

**MONTHLY PROGRESS REPORT #98  
FOR MAY 2005**

**EPA REGION I ADMINISTRATIVE ORDERS SDWA 1-97-1019 and 1-2000-0014**

**MASSACHUSETTS MILITARY RESERVATION  
TRAINING RANGE AND IMPACT AREA**

The following summary of progress is for the period from May 1 to May 31, 2005. Scheduled actions are for the six-week period ending July 15, 2005.

**1. SUMMARY OF REMEDIATION ACTIONS**

The following is a description of remediation actions taken as part of or in preparation for Rapid Response Action (RRA) Plans for various Areas of Concern at Camp Edwards through May 31, 2005. An RRA is an interim action that may be conducted prior to risk assessments or remedial investigations to address a known, ongoing threat of contamination to groundwater and/or soil.

Demo Area 1 Groundwater RRA

The Demo Area 1 Groundwater RRA consists of the removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. Extraction, treatment, and recharge systems (ETR) at Frank Perkins Road and Pew Road include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Pew Road ETR continues operation at a flow rate of 100 gallons per minute (gpm). Perchlorate and hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) have been detected in influent samples. The Granular Activated Carbon (GAC) media was exchanged in the first and second pair of treatment vessels on March 9, 2005. Perchlorate breakthrough was detected after the first pair of GAC vessels on April 14 and April 28, 2005. Perchlorate has not been detected after the second pair of GAC vessels. RDX has not been detected in any mid-fluent samples. Perchlorate and RDX have not been detected in samples collected from the effluent. The next GAC exchange will be scheduled after breakthrough at the second pair of GAC vessels. Based on past operational history, this second GAC exchange is anticipated to be required at the end of June 2005. As of May 27, 2005, approximately 36 million gallons of water have been treated and re-injected at the Pew Road ETR System.

The Frank Perkins Road ETR continues operation at a flow rate of 220 gpm. Perchlorate, RDX, and octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine (HMX) have been detected in influent samples. Perchlorate was detected in mid-fluent samples collected after the first pair of GAC vessels in each of the three treatment containers. The GAC vessels are followed by ion exchange (IX) vessels, which are designed for treatment of perchlorate. Perchlorate and RDX have not been detected in mid-fluent samples collected after the IX vessels or in effluent samples. As of May 27, 2005, approximately 72 million gallons of water had been treated and re-injected at the Frank Perkins Road ETR System.

Demo Area 1 Soil RRA

The Demo Area 1 Soil RRA consists of the removal of all geophysical anomalies within the perimeter road (7.4 acres) and the removal and thermal treatment of contaminated soil from in and around the Demo 1 kettle hole. A total of 16,641 cubic yards of soil was excavated at Demo Area 1, with an additional 195 cubic yards excavated at Demo Area 1 burn pits.

Investigation and removal of unexploded ordnance (UXO) anomalies at targets identified during the EM-61 survey continued. Small anomalies were removed using a mechanical screen.

#### Impact Area Soil RRA

The Impact Area Soil RRA consists of the removal and treatment of contaminated soil and targets at Targets 23 and 42. A total of 590 cubic yards was removed from Target 23 and a total of 796 cubic yards was removed from Target 42 and treated in the Thermal Treatment Unit.

Two lysimeters, installed at Target 42 as part of the Central Impact Area Focused Investigation, that were not holding water were pulled out and will be evaluated.

#### J-2 Range Soil RRA

The J-2 Range Soil RRA consists of the removal and treatment of soil in six general areas within the J-2 Range that contain explosives and perchlorate. Soil removal locations include Twin Berms Area, Berm 2, Berm 5, Fixed Firing Points 3 and 4 (FFP-3 and 4) and adjacent Range Road Burn Area (RRBA), Disposal Area 1, and Disposal Area 2. A total of 6,236 cubic yards of soil was excavated and treated at the Thermal Treatment Unit.

UXO clearance and soil removal was conducted at the J-2 Range Polygon 2 Northern and Southern sections and at Pit 4. UXO clearance commenced at Pit 5. Two burn pits were uncovered during UXO clearance. A post-excavation sample was collected from the first burn pit.

#### J-3 Range Soil RRA

The J-3 Range Soil RRA consists of the removal and treatment of contaminated soil from the Demolition Area and Melt/Pour Building Area. A total of 1,085 cubic yards of soil was excavated from the Demolition Area. A total of 1,146 cubic yards of soil was excavated from the Melt/Pour Building Area. Soil has been treated in the Thermal Treatment Unit or containerized for off-site disposal.

Soil was excavated and containerized from a burn pit identified in May.

## 2. SUMMARY OF ACTIONS TAKEN

Drilling progress for the month of May is summarized in Table 1.

<b>Table 1. Drilling progress as of May 31, 2005</b>				
Boring Number	Purpose of Boring/Well	Total Depth (ft bgs)	Depth to Water Table (ft bgs)	Completed Well Screens (ft bgs)
MW-368	J-2 Range (J2P-53)	351	104	155-165; 202-212; 235-245
MW-369	J-1 Range (J1P-26)	306	116	
MW-370	J-1 Range (J1P-28)	313	122	
DP-371	J-2 Range (J2E-DP1)	212	100	
MW-372	J-2 Range (J2P-55)	315	108	
DP-373	J-2 Range (CP-32B1)	191	83	
ft bgs = ft below ground surface				

Completed well installation at MW-368 (J2P-53) and commenced well installation at MW-369 (J1P-26). Completed drilling at MW-370 (J1P-28), DP-371 (J2E-DP1), MW-372 (J2P-55) and DP-373 (CP-32B1).

Samples collected during the reporting period are summarized in Table 2. Groundwater profile samples were collected from MW-369, MW-370, DP-371, MW-372, and DP-373. Groundwater samples were collected from recently installed wells, residential wells, and as part of the April round of the 2005 Long-Term Groundwater Monitoring (LTGM) Plan. Process water samples were collected from the Pew Road and Frank Perkins Road ETR systems and from the FS-12 ETR system influent and effluent. A post-excavation sample was collected from a burn pit uncovered at the J-2 Range. Pre- and post-detonation samples were collected at the J-2 Range and Demo Area 1. A soil sample was collected near an ordnance item at Demo Area 1 and soil samples were collected as part of the J-2 Range RRA. Surface water samples were collected near a public beach, a private beach, and near the spit at Snake Pond.

The following are the notes from the May 12, 2005 Technical Team meeting of the Impact Area Groundwater Study Program office at Camp Edwards:

#### **J-2 East Drive Point Status**

Dave Hill (IAGWSP) stated that he has reviewed comments submitted by the agencies on the J-2 East Project Note describing the base boundary and off-site direct push investigation. Mr. Hill will provide responses to comments by Friday (5/13). Jay Ehret (USACE) discussed the status and proposed approach for the drive point investigation. The investigation will begin on Monday (5/16) at J2E-DP1. From there, the drive point installations will proceed southward along the eastern boundary swath. Drive point installation at the residential property location is expected to be performed the first or second week of June. There are natural/cultural resources approvals to be obtained for some locations before drilling can begin. If the approval process does not keep up with the actual drilling schedule, the equipment will be moved to the Northwest Corner, as a contingency, while awaiting permit approvals for the remaining J-2 East proposed locations.

Jay Ehret stated that concurrence on the location of J2E-DP2 is essential to move the project forward on schedule. Lynne Jennings (EPA) expressed interest in moving the location closer to the particle back track. Mike Goydas (Jacobs) cautioned that movement of J2E-DP2 to the location suggest by EPA would likely result in overlap with MW-342 groundwater data, and, therefore, he does not recommend changing it.

There was some discussion on the approach to use for installation of the drive point at the residential location. Jay Ehret stated that the location has been moved (based on EPA comment) to approximately 5-10 feet from the existing residential well. Lynne Jennings indicated that the Project Note states that a permanent structure (such as a piezometer or monitoring well) may be installed at locations that warrant it (e.g., contamination detected at depth) based on drill point profile results. Jay Ehret stated that a permanent installation on a residential property would require an easement. Gina Kaso (USACE) stated that the easement process will be initiated, if necessary. Mark Panni (DEP) suggested that, as a possible alternative, the Army consider installation of a temporary structure to possibly fulfill the groundwater elevation data needs, and avoid the easement permit process.

Jay Ehret also summarized some monitoring well installation schedule changes. Monitoring well J2P-53 was installed instead of J1P-28. The next location to be drilled will be J2P-55 (J2E-18).

**CIA FSSR Assembly of Alternatives**

Bill Gallagher (IAGWSP) discussed the need for a five month extension in the schedule (to October 7, 2005) for submission of the CIA draft Feasibility Study Screening Report (FSSR). Lynne Jennings asked that a detailed written justification for the extension of the report due date be provided. Mr. Gallagher agreed to write up the justification for the extension, which is needed to adequately evaluate each alternative, perform modeling, and for internal review of the report. The write up will also include a schedule for development of a work plan to address data gaps identified during previous meetings (e.g., UXO Work Plan, corrosion study report). Ms. Jennings asked if UXO sampling issues would be rolled into the FSSR report. Mr. Gallagher stated that UXO would be considered as part of the FSSR. Mr. Gallagher stated that it is recommended that the work plan proposed for HUTA/SCAR be substituted with a work plan to better refine source areas believed to be contributing to groundwater contamination in the CIA. The development of recent state of the art sampling techniques (i.e., multi point composite sampling) warrants consideration and changes to previous submitted work plans. Mr. Gallagher stated that the UXO Corrosion Study Summary Report will be submitted by May 20, 2005. This report is intended to summarize current understanding of UXO corrosion. The Army does not anticipate agency comments on this document since it is a summary of other entities work. Ms. Jennings stated that she anticipates any agency comments will be tied to any conclusions made in the corrosion report that are relevant to the development of the Feasibility Study report.

Lynne Jennings suggested that interim milestones and deliverables be developed for the FSSR, starting with submission of an outline of the report and a schedule for interim deliverables. Kim Groff (AMEC) and Bill Gallagher stated that discussion notes (emerging decisions), assumptions, and example model runs will be provided to the agencies on an on-going basis.

Kim Groff and Herb Colby (AMEC) presented a table showing the revised draft Assembly of Alternatives. This table had been edited based on the discussions that ensued at the last tech meeting (4/28/05). Currently there are eight alternatives with 20 variants. Ms. Jennings expressed concern about using a 30-year time duration, rather than a more aggressive option, for partial aquifer restoration alternatives. Bill Gallagher stated that adjustments to the time duration can be made during the modeling effort to allow more flexibility with the duration, while balancing the time constraints for additional variations to the model runs and maintaining a sufficient level of confidence. It was agreed that the next step is for the agencies to comment on the current list of alternatives. Bill Gallagher will provide a schedule for all other deliverables. Further discussions will continue at the next tech meeting (5/26/05). Topics to be discussed include the number of modeling runs for the FSSR.

**Demo 1 RSP Status**

Discussion of the Demo 1 Remedy Selection Plan (RSP) was postponed to the RPM meeting.

**Revised Combined Schedule Comment Resolution**

Notes from the discussion on the Revised Combine Schedule will be included in a separate memorandum of resolution.

**Miscellaneous**

Jane Dolan (EPA) asked the Army to look into the origin of the samples (identified as SSJ1RD010, SSJ1RD014, SSJ1RD017, SSJ1RD018, SSJ1RD022 soil grab series and SSJ2SG001-004 soil grid series) listed in Table 2 of the April Monthly Progress Report.

**IART Meeting for May 2005**

The EPA convened a meeting of the Impact Area Groundwater Review Team on May 24, 2005. The agenda included a presentation on the J-2 Range North Groundwater RRA Plan, remediation and investigation updates including the Central Impact Area, and an update on the revised combined schedule.

**3. SUMMARY OF DATA RECEIVED**

Validated data were received during May 2005 for Sample Delivery Groups (SDGs): CE0485, CE0486, CE0487, CE0488, CE0489, CE0490, CE0491, CE0493, CE0496, CE0497, CEM104, DCE038, EC0510, EC0520, EC0524, GCE264, GCE265, GCE266, GCE267, GCE268.

These SDGs contain results for 146 groundwater samples from supply, sentry, and monitoring wells; 24 process water samples from the Frank Perkins and Pew Road ETR systems; 60 soil grid samples from the L Range and Former K Range; 10 samples of wax filler from inert munitions; and 8 soil samples from the Former A Range and 10 wax filler samples from inert munitions for TCLP (Toxicity Characteristic Leaching Procedure) leachate analysis.

**Validated Data**

Table 3 summarizes the detections that exceeded an EPA Maximum Contaminant Level (MCL) or Health Advisory (HA) for drinking water, or exceeded a 4 ppb concentration for perchlorate, sorted by analyte, since 1997. Table 3 is updated on a monthly basis; discussions in the text are updated on the same schedule as Figures 1 through 8, which are discussed later in this section.

Table 4 summarizes first-time validated detections of explosives below the MCL/HA for drinking water or of perchlorate below a 4 ppb concentration received from April 29, 2005 through May 27, 2005. First-time validated detections of VOCs, SVOCs, herbicides and pesticides are included and discussed quarterly in the March, June, September, and December Monthly Progress Reports. Metals, chloroform, and BEHP are excluded from Table 4 for the following reasons: metals are a natural component of groundwater, particularly at levels below MCLs or HAs; detections of chloroform are pervasive throughout Cape Cod and are not likely the result of military training activities; and BEHP is believed to be largely an artifact of the investigation methods and introduced to the samples during collection or analysis.

Figures 1 through 8 depict the cumulative results of groundwater analyses for the period from the start of the Impact Area Groundwater Study (July 1997) to the present. Each figure depicts results for a different analyte class:

- Figure 1 shows the results of explosive analyses by EPA Method 8330. This figure is updated and included each month.
- Figure 2 shows the results of inorganic analyses (collectively referred to as "metals", though some analytes are not true metals) by methods E200.8, 300.0, 350.2M, 353M, 365.2, CYAN, IM40MB, and IM40HG. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 3 shows the results of Volatile Organic Compound (VOC) analyses by methods OC21V, OC21VM, 504, 8021W, and SW8260 exclusive of chloroform detections. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.

- Figure 4 shows the chloroform results using the Volatile Organic Compound (VOC) analyses by method OC21V and OC21VM. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 5 shows the results of Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270, exclusive of detections of bis (2-ethylhexyl) phthalate (BEHP). This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 6 shows the BEHP results using the Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 7 shows the results of Pesticide (method OL21P) and Herbicide (method 8151) analyses. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 8 shows the results of Perchlorate analysis by method E314.0. This figure is updated and included each month.

The concentrations from these analyses are depicted in Figures 1 through 7 compared to Maximum Contaminant Levels (MCLs) or Health Advisories (HAs) published by EPA for drinking water. For Figures 1 through 7, a red circle is used to depict a well where the concentration of one or more analytes was greater than or equal to the lowest MCL or HA for the analyte(s). A yellow circle is used to depict a well where the concentration of all analytes was less than the lowest MCL or HA. A green circle is used to depict a well where the given analytes were not detected in groundwater samples. For Figure 8, a red circle is used to depict a well where the concentration of perchlorate was greater than or equal to 4 ppb. An orange circle is used to depict a well where the concentration of perchlorate is above 1 ppb and below 4 ppb. A yellow circle is used to depict a well where the concentration of perchlorate was less than 1 ppb. A green circle is used to depict a well where perchlorate was not detected in groundwater samples. For all figures, an open circle is used to depict a proposed well where the analytes in question for example, Explosives in Figure 1, have not yet been quantified. A black circle represents a well that has been sampled for analytes, but validated groundwater data is not yet available.

There are multiple labels listed for some wells in Figures 1 through 8, which indicate multiple well screens at different depths throughout the aquifer. The aquifer is approximately 200 to 300 feet thick in the study area. Well screens are positioned throughout this thickness based on various factors, including the results of groundwater profile samples, the geology, and projected locations of contaminants estimated by groundwater modeling. The screen labels are colored to indicate which of the depths had the chemical detected above MCLs/HAs/4 ppb concentration for perchlorate. Generally, groundwater entering the top of the aquifer will move deeper into the aquifer as it moves radially outward from the top of the water table mound. Light blue dashed lines in Figures 1 through 8 depict water table contours. Groundwater generally moves perpendicular to these contours, starting at the center of the 70 foot contour (the top of the mound) and moving radially outward. The rate of vertical groundwater flow deeper into the aquifer slows as groundwater moves away from the mound.

The results presented in Figures 1 through 8 are cumulative, which provides a historical perspective on the data rather than a depiction of current conditions. Any detection at a well that equals or exceeds the MCL/HA/4 ppb concentration for perchlorate results in the well having a red symbol, regardless of later detections at lower concentrations, or later non-detects. The difference between historical and current conditions varies according to the type of analytes. There are little or no differences between historical and current exceedances of

drinking water criteria for Explosives, Perchlorate, VOCs, Pesticides, and Herbicides; the minor differences are mentioned in the following paragraphs. There are significant differences between historical and current exceedances of drinking water criteria for Metals and SVOCs, as described further below.

#### Figure 1: Explosives in Groundwater Compared to MCLs/HAs

For data validated in May 2005, no wells had first-time validated detections of explosives above the MCL/HAs. One well, MW-163S (J-3 Range) had a validated detection of RDX at a concentration of 33 ug/L, which is more than twice the previous maximum concentration of 13 ug/L. One well, MW-223M1 (Impact Area) had a first-time validated detection of RDX below the HA of 2 ppb.

Exceedances of drinking water criteria for explosive compounds are indicated in six general areas:

- Demo Area 1 (wells 19, 31, 34, 73, 76, 77, 114, 129, 165, 210, and 211);
- Demo Area 2 (wells 16, 160, 259 and 262);
- The Impact Area and CS-19 (wells 58MW0001, 58MW0002, 58MW0009E, 58MW0011D, 58MW0016B, 58MW0016C, 58MW0018B; and wells 1, 2, 23, 25, 37, 38, 40, 43, 85, 86, 87, 88, 89, 90, 91, 93, 95, 98, 99, 100, 101, 105, 107, 111, 112, 113, 176, 178, 184, 201, 203, 204, 206, 207, 209, 223, 235, OW-1, OW-2, and OW-6);
- J Ranges and southeast of the J Ranges (wells 45, 58, 132, 147, 153, 163, 164, 166, 171, 191, 196, 198, 215, 218, 227, 234, 247, 265, 289, 303, 306, 324, 326, 343, and wells 90MW0022, 90MW0041, 90MW0054 and 90WT0013).
- Landfill Area 1 (wells 27MW0018A, 27MW0020A, and 27MW0020B); and
- Northwest Corner of Base Boundary (well 323)

Exceedances of drinking water criteria were measured for TNT at Demo Area 1 (wells 19S, 31S, 31M, and 31D) and Southeast of the Ranges (196S). Exceedances of the HA for RDX were noted at all of the locations listed above except at MW-45, MW-196, and the LF-1 wells. Exceedances of drinking water criteria were measured for 2,6-dinitrotoluene (2,6-DNT) at MW-45S. Exceedances of drinking water criteria were measured for 1,3-dinitrobenzene at LF-1 wells 27MW0018A, 27MW0020A and 27MW0020B.

A magenta concentration contour line is used in Figure 1 and Inset A to show the extent of RDX exceeding the HA in these areas. This extent is based on samples from monitoring wells and samples collected during the drilling process ("profile" samples). This extent also considers non-validated data, where the results have been confirmed using Photo Diode Array (PDA). Additional information regarding PDA is provided below under the heading "Rush (Non-Validated) Data". Concentration contours will be prepared for other areas, and refined for the above areas, when sufficient data are available.

Demo Area 1 has a single well-defined source area and extent of contamination. The estimated extent of RDX exceeding the HA at Demo Area 1 based on the most recent groundwater measurements is indicated by a magenta concentration contour line on Figure 1 and Inset A.

Demo Area 2 has four groundwater exceedances of the RDX HA at MW-16S, MW-160S, MW-259, and MW-262M1. The extent of the contamination is currently under investigation.

The Impact Area has a plume defined by RDX concentrations above the HA of 2 ppb. The plume originates primarily along Turpentine Road and extends downgradient to the east, northeast. Another source of RDX in the Impact Area is CS-19. Portions of CS-19 are currently under investigation by the Air Force Center for Environmental Excellence (AFCEE) under the Superfund program. The extent of RDX has largely been defined in the Impact Area and the investigation phase of the project is nearing completion.

The J Ranges and downgradient areas have five groundwater plumes defined by concentrations of RDX above the HA of 2 ppb. The five plumes originate at the J-1 Range Interberm Area (northern plume in the vicinity of MW-58 and MW-265), the J-2 Range North plume (northern plume extending from MW-130), the J-2 Range East plume (eastern plume including MW-215), the J-3 Range Demolition Area (southern plume extending from MW-163 south to Snake Pond) and the L Range (in an area defined by MW-147 and MW-153 at Greenway Road). All the J ranges and the L Range are currently under investigation and the plumes will be updated and refined as new validated data is received.

The Northwest Corner of the base boundary has one validated detection of RDX in groundwater above the HA of 2 ppb at MW-323M2. The M1 screen in this location has a validated detection of RDX in groundwater below 2 ppb.

Figure 2: Metals in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for metals are scattered throughout the study area. Where two or more rounds of sampling data are available, the exceedances generally have not been replicated in consecutive sampling rounds. The exceedances have been measured for antimony, arsenic, cadmium, chromium, lead, molybdenum, sodium, thallium and zinc. Arsenic (well 7M1), cadmium (52M3), and chromium (7M1) each had one exceedance in a single sampling round in August-September 1999. Two of four lead exceedances (ASP well and 45S) were repeated in another sampling round and the remaining two lead exceedances (wells 2S and 7M1) have not been repeated in previous or subsequent results. Two of the eight molybdenum exceedances were repeated in consecutive sampling rounds (wells 53M1 and 54S). All of the molybdenum exceedances were observed in year 1998 and 1999 results. Seven of the 19 sodium exceedances were repeated in consecutive sampling rounds (wells 2S, 46S, 57M2, 57M1, 145S, ASP well and SDW261160). Eight wells (21S, 57M1, 57M3, 144S, 145S, 148S, 187D, and the ASP well) had sodium exceedances in year 2002, 2003, and/or 2004 results. Zinc exceeded the HA in seven wells, all of which are constructed of galvanized (zinc-coated) steel.

There have been few exceedances of drinking water limits for antimony and thallium since the introduction of the ICP/GFAA and ICP/MS methods, discussed in the next paragraph. None of the 12 antimony exceedances were repeated in consecutive sampling rounds, and only one exceedance (well 187D) was measured in year 2002 results. Eight of the 71 thallium exceedances were repeated in consecutive sampling rounds (wells 7M1, 7M2, 47M2, 52S, 52D, 54S, 54M1, and 94M2). Only two wells (148S and 191M1) have had thallium exceedances in the year 2002. There have been no exceedances of thallium in 2003, 2004 or thus far in 2005.

Groundwater samples sent for metals analysis are analyzed for most metals by Inductively Coupled Plasma (ICP) in accordance with U.S. EPA Contract Laboratory Program Statement of Work ILM04.0. In May of 2001, the IAGWSP began analyzing for antimony and thallium using the GFAA (graphite furnace atomic adsorption) method in accordance with EPA Drinking Water Methods 204.2 (antimony) and 279.2 (thallium) in order to achieve lower detection limits for

these metals. Both the ILM04.0 and GFAA methods are subject to false positive results at trace levels due to interferences. As a result, the IAGWSP changed to a new method to achieve lower detection limits for antimony and thallium in January of 2003. Groundwater samples are now analyzed for antimony and thallium by Inductively Coupled Plasma/Mass Spectroscopy (ICP/MS) in accordance with the EPA Method 6020. The ICP/MS Method 6020 has greater sensitivity and the added feature of selectivity for antimony and thallium. These additional methods achieve lower detection limits for these two metals and reduce the number of false positive results.

The distribution and lack of repeatability of the metals exceedances is not consistent with a contaminant source, nor do the detections appear to be correlated with the presence of explosives or other organic compounds. The IAGWSP has re-evaluated inorganic background concentrations using the expanded groundwater quality database of 1999, and has submitted a draft report describing background conditions. The population characteristics of the remaining eight metals were determined to be consistent with background. This figure was last included and updated in the March 2005 Monthly Report.

Figure 3: VOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for VOCs are indicated in six general areas: Northeast Corner (LRMW003), Monument Beach Field Well (02-12, 80M2), CS-10 (wells 03MW0007A, 03MW0014A, and 03MW0020), LF-1 (well 27MW0017B), FS-12 (wells MW-45S, 90MW0003, and ECMWSNP02D), and in the J-1 Range (187D). CS-10, LF-1, and FS-12 are sites located near the southern extent of the Training Ranges that are currently under investigation by AFCEE under the Superfund program. Exceedances of drinking water criteria were measured for tetrachloroethylene (PCE) at CS-10, for vinyl chloride at LF-1, and for toluene, 1,2-dichloroethane, and ethylene dibromide (EDB) at FS-12. These compounds are believed to be associated with the sites under investigation by AFCEE. Detections of benzene, tert-butyl methyl ether, and chloromethane at J-1 Range well 187D, and chloromethane at Western Boundary wells 02-12M1 and 80M2 and chloromethane at Northeast corner well LRMW003 are currently under investigation. This figure was last included and updated in the March 2005 Monthly Report.

Figure 4: Chloroform in Groundwater Compared to MCLs

Chloroform has been widely detected in groundwater across the Upper Cape as stated in a joint press release from USEPA, MADEP, IRP, and the Joint Programs Office. The Cape Cod Commission (2001) in their review of public water supply wells for 1999 found greater than 75% contained chloroform with an average concentration of 4.7 ug/L. The IRP has concluded chloroform is not the result of Air Force activities. A detailed discussion of the presence of chloroform is provided in the Final Central Impact Area Groundwater Report (06/01). To date, the source of the chloroform in the Upper Cape groundwater has not been identified. This figure was last included and updated in the December 2004 Monthly Report.

Figure 5: SVOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for SVOCs are scattered throughout the study area. All exceedances of drinking water criteria for SVOCs were measured for bis (2-ethylhexyl) phthalate (BEHP), with the exception of two wells. MW-264M1 (J-3 Range) had a detection of benzo(a)pyrene at concentrations of more than twice the HA and MW-241M1 (L Range) had a detection of naphthalene above the HA of 100 ppb. Detections of BEHP are presented

separately in Figure 6 and discussed in the next paragraph. This figure was last included and updated in the March 2005 Monthly Report.

Figure 6: BEHP in Groundwater Compared to MCLs

Exceedances of drinking water criteria for bis (2-ethylhexyl) phthalate (BEHP) are scattered throughout the study area. BEHP is believed to be largely an artifact of the investigation methods, introduced to the samples during collection or analysis. However, the potential that some of the detections of BEHP are the result of activities conducted at MMR has not been ruled out.

A detailed discussion of the presence of BEHP is provided in the Draft Completion of Work Report (7/98) and subsequent responses to comments. The theory that BEHP mostly occurs as an artifact, and is not really present in the aquifer, is supported by the results of subsequent sampling rounds that show much lower levels of the chemical after additional precautions were taken to prevent cross-contamination during sample collection and analysis. Only four locations (out of 90) showed BEHP exceedances in consecutive sampling rounds: 28MW0106 (located near SD-5, a site under investigation by AFCEE), 58MW0006E (located at CS-19), and 90WT0013 (located at FS-12), and 146M1 (located at L Range). Subsequent sampling rounds at all these locations have had results below the MCL. Eleven wells (27MW0705, 27MW2061, C2-B, C6-C, C7-B, 47M2, 164M1, 168M1, 188M1, 196M1, and 198M1) had BEHP exceedances in the year 2002 and 2003 results. There have been no exceedances of BEHP in 2004 or thus far in 2005. This figure was last included and updated in the December 2004 Monthly Report.

Figure 7: Herbicides and Pesticides in Groundwater Compared to MCLs/HAs

There has been one exceedance of drinking water criteria for pesticides, at well PPAWSMW-1. A contractor to the United States Air Force installed this monitoring well at the PAVE PAWS radar station in accordance with the Massachusetts Contingency Plan (MCP), in order to evaluate contamination from a fuel spill. The exceedance was for the pesticide dieldrin in a sample collected in June 1999. This well was sampled again in November 1999. The results of the November sample indicate no detectable pesticides although hydrocarbon interference was noted. It appears from the November sample that pesticides identified in the June sample were false positives. However, the June sample results cannot be changed when following the EPA functional guidelines for data validation. The text of the validation report for the June sample has been revised to include an explanation of the hydrocarbon interference and the potential for false positives.

There has been one exceedance of drinking water criteria for herbicides, at well 41M1 (Impact Area). This response well was installed downgradient of the Impact Area. The exceedance was for the herbicide pentachlorophenol in a sample collected in May 2000. There were no detections above the MCL of this compound in the three previous sampling rounds in 1999, nor in the subsequent sampling rounds in 2000, 2001, and 2002. This figure was last included and updated in the March 2005 Monthly Report.

Figure 8: Perchlorate in Groundwater Compared to a 4 ppb Concentration

For data validated in May 2005, three wells, MW-225M3 (Demo 1), and MW-346M1 & M2 (J-1 Range) had first-time validated detections of perchlorate above the concentration of 4 ppb. One well, MW-198M3 (J-3 Range) had a validated detection of perchlorate at a concentration of 730 ug/L, which is more than twice the previous maximum concentration of 310 ug/L. One well, MW-331M1 (J-2 Range), had a first-time validated detection of perchlorate below the concentration of 4 ppb.

Sampling and analysis of groundwater for perchlorate was initiated at the end of the year 2000 as part of the IAGWSP. Exceedances of the 4 ppb concentration of perchlorate are indicated in six general areas:

- Demo Area 1 (wells 19, 31, 32, 34, 35, 36, 73, 75, 76, 77, 78, 114, 129, 139, 162, 165, 172, 210, 211, 225 and 341);
- Impact Area (well 91);
- J Ranges and southeast of the J Ranges (wells 127, 130, 132, 143, 163, 193, 197, 198, 232, 247, 250, 263, 265, 289, 293, 300, 302, 303, 305, 307, 310, 313, 321, 326, 339, 346, 348 and wells 90PZ0211, 90MW0022 and 90MW0054);
- Landfill Area 1 (27MW0031B);
- CS-18 (well 16MW0001); and
- Northwest Corner of Base Boundary (wells 4036009DC, 270, 277, 278, and 279).

A magenta concentration contour line is used in Figure 8 and the inset to show the extent of perchlorate greater than a 4 ppb concentration of perchlorate. This extent is based on samples from monitoring wells and samples collected during the drilling process ("profile" samples).

Demo Area 1 has a single well-defined source area and extent of contamination. The downgradient extent of the perchlorate plume has been determined with the installation of monitoring wells along the power line right-of-way east of Fredrickson Road.

The Impact Area has a single exceedance of the 4 ppb concentration of perchlorate at MW-91S.

Plumes have been identified in four areas in the J Ranges as shown on Figure 8. The J-1 Interberm perchlorate plume has several detections of greater than 4 ppb in downgradient locations MW-265, MW-303, MW-326, and MW-346. The J-3 Range Demolition perchlorate plume has concentrations greater than 4 ppb in several wells immediately downgradient of the source area, which is centered at MW-198, and further downgradient centered around location 90MW0054. The J-2 Range North perchlorate plume has detections greater than 4 ppb at source area locations MW-130 and MW-263, and downgradient locations MW-289, MW-293, MW-300, MW-302, MW-305, and MW-313. The J-2 East perchlorate plumes are in the process of delineation and include detections greater than 4 ppb at MW-307 and MW-310. Perchlorate detections at the L Range are below 4 ppb and a plume is not depicted on the figure.

The Northwest Corner has a perchlorate plume extending from Canal View Road at the base boundary to the Cape Cod Canal. This area is under investigation and the plume will be updated and refined as new data is received.

The LF-1 and CS-18 areas are under investigation by AFCCEE in the Superfund Program.

### Rush (Non-Validated) Data

Rush data are summarized in Table 5. These data are for analyses that are performed on a fast turnaround time, typically 1 to 10 days. Explosive analyses for monitoring wells, and explosive and VOC analyses for profile samples, are typically conducted in this timeframe. Other types of analyses may be rushed depending on the proposed use of the data. The rush data have not yet been validated, but are provided as an indication of the most recent preliminary results. Table 5 summarizes only detects, and does not show samples with non-detects.

The status of the detections with respect to confirmation using Photo Diode Array (PDA) spectra is indicated in Table 5. PDA is a procedure that has been implemented for the explosive analysis, to reduce the likelihood of false positive identifications. Where the PDA status is "YES" in Table 5, the detected compound is verified as properly identified. Where the status is "NO", the identification of an explosive has been determined to be a false positive. Where the status is blank, PDA has not yet been used to evaluate the detection, or PDA is not applicable because the analyte is a VOC. Most explosive detections verified by PDA are confirmed to be present upon completion of validation.

Table 5 includes the following detections:

#### Demo Area 1

- Process water samples collected from the Frank Perkins Road ETR system influent (FPR-INF) and mid-fluent (FPR-MID-1) had detections of perchlorate. Process water samples collected from the influent (FPR-INF) also had detections of RDX and HMX, which were confirmed by PDA spectra.
- Process water samples collected from the Pew Road ETR system influent (PR-INF) and mid-fluent (PR-MID-1) had detections of perchlorate. Process water samples collected from the influent (PR-INF) also had detections of RDX, which were confirmed by PDA spectra.

#### J-1 Range

- Profile samples from MW-369 (J1P-26) had detections of explosives and VOCs. Of the explosives detections, RDX was confirmed by PDA spectra in three intervals at 104 ft bwt and between 134 and 144 ft bwt and 1,3,5-trinitrobenzene was confirmed by PDA spectra, but with interference, at 14 ft bwt. Well screens were set at the depth (59 to 69 ft bwt) corresponding to the depth of contamination in the J-1 plume to the east of MW-369, at the depth (99 to 109 ft bwt) corresponding to the shallow detection of RDX, and at the depth (137 to 147 ft bwt) corresponding to the deepest detection of RDX.
- Profile samples from MW-370 (J1P-28) had detections of explosives, perchlorate and VOCs. Of the explosive detection, RDX was confirmed by PDA spectra in one interval at 98 ft bwt and 2,6-dinitrotoluene was confirmed by PDA spectra, but with interference, in three intervals between 28 and 48 ft bwt. Perchlorate was detected in four intervals between 88 and 118 ft bwt. Well screens will be set at the depth (63 to 73 ft bwt) corresponding to the interval above the shallowest perchlorate detection, at the depth (93 to 103 ft bwt) corresponding to the highest perchlorate detection and the RDX detection, and at the depth (123 to 133 ft bwt) corresponding to the interval below the deepest perchlorate detection.

**J-2 Range**

- Profile samples from DP-371 (J2E-DP1) had detections of explosives and perchlorate. Of the explosive detections, 3-nitrotoluene was confirmed by PDA spectra, but with interference, in one interval at the water table. Perchlorate was detected in two intervals between 100 and 112 ft bwt. The drive point screen (107 to 112 ft bwt) will be left in place and final screen depth(s) will be determined based on results from other fence-line drive points.
- Profile samples from MW-372 (J2P-55) had detections of explosives and VOCs. Of the explosive detections, 2,6-dinitrotoluene was confirmed by PDA spectra, but with interference in two intervals at 12 and 42 ft bwt and 3-nitrotoluene was confirmed by PDA spectra, but with interference in one interval at 62 ft bwt. Well screens will be set at the depth (164 to 174 ft bwt) corresponding to the depth that forward particle tracks from MW-324M2 would intersect the MW-372 borehole and at the depth (192 to 202 ft bwt) corresponding to the depth that forward particle tracks from MW-334M1, MW-310M1, and MW-324M1 would intersect the MW-372 borehole.

**4. DELIVERABLES SUBMITTED**

Deliverables submitted during the reporting period include the following:

Monthly Progress Report # 97 for April 2005	05/09/2005
Interim Month Report for May 1 – May 13, 2005	05/20/2005
Summary of Corrosion Mechanisms and Corrosion Potential of Unexploded Ordnance at Camp Edwards	05/20/2005
Draft Demo 1 Groundwater RRA Completion Report	05/25/2005
Draft J-3 Range RRA Completion Report	05/25/2005
Draft Demo 2 Soil RRA Completion of Work and Operable Unit Closure Report	05/31/2005

**5. SCHEDULED ACTIONS**

Figure 9 provides a Gantt chart updated to reflect progress and proposed work. The following documents are scheduled to be submitted in June and early July:

- Demo Area 1 Soil Final RRA Completion Report
- J-1 Range Groundwater Draft Report
- J-3 Range Groundwater Draft Report
- Central Impact Area Groundwater Draft Remedy Selection Plan

The following documents are being prepared or revised during June and early July:

- J-2 Range Groundwater Final Report
- Demo Area 1 Soil Draft Final Feasibility Study Screening Report
- Demo Area 1 Groundwater Final Decision Document and Response Summary
- Central Impact Area Soil Draft Remedy Selection Plan
