

**MONTHLY PROGRESS REPORT #107
FOR FEBRUARY 2006**

EPA REGION I ADMINISTRATIVE ORDERS SDWA 1-97-1019 and 1-2000-0014

**MASSACHUSETTS MILITARY RESERVATION
TRAINING RANGE AND IMPACT AREA**

The following summary of progress is for the period from February 1 to February 28, 2006. Scheduled actions are for the six-week period ending April 14, 2006.

1. SUMMARY OF REMEDIATION ACTIONS

The following is a description of remediation actions taken as part of or in preparation for Rapid Response Action (RRA) Plans for various Areas of Concern at Camp Edwards through February 28, 2006. An RRA is an interim action that may be conducted prior to risk assessments or remedial investigations to address a known, ongoing threat of contamination to groundwater and/or soil.

Demo Area 1 Groundwater RRA

The Demo Area 1 Groundwater RRA consists of the removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. Extraction, treatment, and recharge systems (ETR) at Frank Perkins Road and Pew Road include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Pew Road ETR continues operation at a flow rate of 100 gallons per minute (gpm). As of February 24, 2006, approximately 72 million gallons of water have been treated and re-injected at the Pew Road ETR System.

The Frank Perkins Road ETR continues operation at a flow rate of 220 gpm. Granular activated carbon (GAC) change-out of two vessels per treatment container was completed during the week ending February 17, 2006. As of February 24, 2006, approximately 161 million gallons of water had been treated and re-injected at the Frank Perkins Road ETR System.

Drilling for extraction wells EW-D1-501 and EW-D1-502 along Pocasset-Forestdale Road and re-injection well IW-D1-4 on Pew Road was completed. Drilling for extraction well EW-D1-503 commenced.

J-2 Range Groundwater RRA

The J-2 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and infiltration basins to return treated water to the aquifer.

Completed installation of extraction well J-2 EW0001 and at J-2 EW0003. Intrusive anomaly removal within the footprint of the J-2 ETR system resumed. Four BIPs were conducted along Wood Road near the intersection of Barlow Road. Pre- and post-BIP samples were collected in accordance with sampling protocol. BIP crater soils were excavated and staged onsite pending characterization and off-site disposal.

J-3 Range Groundwater RRA

The J-3 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater and use of the existing Fuel Spill-12 (FS-12) infiltration gallery to return treated water to the aquifer.

Work was not conducted as part of the J-3 Range Groundwater RRA during February.

2. SUMMARY OF ACTIONS TAKEN

Drilling progress for the month of February is summarized in Table 1.

Table 1. Drilling progress as of February 28, 2006				
Boring Number	Purpose of Boring/Well	Total Depth (ft bgs)	Depth to Water Table (ft bgs)	Completed Well Screens (ft bgs)
MW-435	Demo 2 (D2P-11)	132	122	
ft bgs = ft below ground surface				

Commenced drilling at MW-435 (D2P-11).

Samples collected during the reporting period are summarized in Table 2. Groundwater profile samples were collected from MW-435. Groundwater samples were collected from recently installed wells, and as part of the December round of the 2005 Long-Term Groundwater Monitoring (LTGM) Plan. Wipe samples were collected from ordnance related scrap items recovered from trenches excavated as part of the Former A Range Remedial Investigation. Soil samples (30-point composite samples) were collected from the Impact Area as part of HUTA II/SCAR sampling.

The following bullets summarize the Blown-in-Place (BIP) items for the month of February:

- J-1 Range:
February 2, 2006: Four (4) 105 mm, high explosive anti-tank M456 (at Grid J-15)
- J-3 Range North of Demolition Area:
February 9, 2006: One (1) 81 mm Projectile (at Grid E-6)
February 16, 2006: One (1) 90 mm HEI Projectile (at Grid D-5)

Pre- and post-BIP samples, summarized in Table 2, were collected in accordance with the sampling protocol.

Anomaly investigation as part of the J-3 Range North of the Demolition Area Geophysical Investigation was conducted at grids E-4, E-5, E-6, D-5, and D-6. Table 3 shows a grid sheet summary for excavations and munitions recovered for the J-3 Range North of the Demolition Area Geophysical Investigation for the period ending February 23, 2006.

There have been no munitions and explosives of concern (MEC) items destroyed in the controlled detonation chamber (CDC) during February.

The following are the notes from the February 16, 2006 Technical Team meeting of the Impact Area Groundwater Study Program office at Camp Edwards:

CIA FSSR Alternative 2 Modeling Results

The Central Impact Area (CIA) Feasibility Study Screening Report (FSSR) groundwater modeling results for Alternative 2 were presented by Bill Gallagher (IAGWSP) using a slide show and handout. Alternative 2 is a remedial alternative that will include partial source removal without groundwater remediation. Options for this alternative, considering several different sizes and locations of removal areas, were last presented to EPA and MassDEP in a meeting on 8/11/05. Revisions to these options were made in response to agency comments. This presentation shows the results of groundwater modeling for those revisions and recommends a representative source removal option to carry through the FSSR evaluation. The source removal option will be paired with a range of groundwater management options for the CIA. The selection of a representative source removal option will help reduce the number of variants evaluated in the FSSR to a manageable number (reduce options from 57 to 14). The presentation contains 19 slides including the title slide.

- Slide 2 indicates the five points to be covered by the presentation: Objectives, Methodology, Results, Conclusions, and Path Forward
- Slide 3 indicates the FSSR Objectives which are to identify and evaluate a set of remedial alternatives that address soil and groundwater, and to select a subset of alternatives for detailed evaluation in the FS
- Slide 4 indicates the Alternative 2 Objectives which are to evaluate the impact of partial source removal on future plume characteristics, and to select a partial source removal option to carry forward in modeling evaluations
- Slides 5-8 indicate the three options for partial source removal that were evaluated and the Methodology for the evaluation. The three options involved different source areas and sizes: 1) 14 acres along roadways near the intersection of Turpentine Road and Tank Alley; 2) 24 acres in three separate areas (delineated by interpretation of RDX in shallow groundwater above 2 ppb) including the above roadways, CS-19, and an area near MW-86; and 3) 80 acres covering all source areas predicted by groundwater modeling (delineated by interpretation of RDX in shallow groundwater above 0.25 ppb). Maps of the removal options were provided. Groundwater modeling was performed using the 2003 plume shells carried out 40 years. Metrics for the evaluation were maximum RDX concentration (C-max), RDX plume volume (>0.6 and >2 ppb), and RDX plume mass. In response to a question from Len Pinaud (MassDEP), Scott Greene (USACE) indicated that a review of 2004 groundwater data showed no significant trends in the source areas, i.e. the 2003 plume shells still appear to be a valid starting point for modeling.
- Slide 9 is a table comparing the three options in terms of size and the model-estimated reduction in source loading. The estimated reductions are 29% for 14 acres, 55% for 24 acres, and 100% for 80 acres.
- Slide 10 provides a graph of C-max over the 40-year modeling period for each of the three options, and for a “no additional removal” (beyond 2004 removals) option. Chris Abate (AMEC) explained that the source loading is conservatively increased at the start of modeling to produce a C-max near 34 ppb prior to the 2004 removals. Lynne Jennings (EPA) requested info on historic maximum observed RDX concentrations at CS-19 vs. other parts of the Impact Area. Removal actions conducted in 2004 at Targets 23 and 42 as well as the removal action at CS-19 result in an instantaneous drop in C-max to 17 ppb. The 14-ac option has no further drop in C-max. The 24-ac option results in a C-max of 7.3 ppb that has leveled off after 40 years and the 80-ac option results in a C-max of 3.5 ppb that is still dropping after 40 years. Ms. Jennings requested the years by which the 80-ac C-max would

reach 2 ppb and 0.6 ppb. She noted that the 80-ac option appears to be the only option that achieves or approaches these levels.

- Slides 11 and 12 provide graphs of >0.6 ppb plume volume and >2 ppb plume volume, respectively, over the 40-year modeling period for each of the three removal options and the no removal option. The total RDX plume volume >0.6 ppb increases over the 40 years for all options, though less so for the larger removal areas. Ms. Jennings requested info on modeled plume volumes at the end of the 40-year period. RDX plume volume >2 ppb decreases over the 40 years for all options, and more so for the larger removal areas. Attendees discussed the relative amounts of volume reductions. Mr. Abate noted the comparatively slow changes in plume volume rates of change, relative to C-max rates of change.
- Slide 13 provides a graph of RDX plume mass over the 40-year modeling period for each of the three removal options and for the no removal option. Plume mass increases for all options until the assumed time of the removal, then decreases for removal options at a rate based on the amount of the removal. Desiree Moyer (EPA) asked whether the 24-ac option covers areas already removed at CS-19 and Targets 23 & 42, i.e. whether the mapped removal areas actually total 24 acres or slightly less. Mr. Abate will check whether this is the case, but noted that even if the mapped areas were increased by a few acres it would have little impact on modeled results since the increases would come in weaker source areas.
- Slides 14 and 15 provide a table and graph, respectively, comparing the modeling results for the three removal options and the no removal option, using the three metrics identified above and also cost assuming a rate of \$1.7M/acre. Ms. Jennings requested that the no removal option cost of \$2M (based on the 2004 removals) be set to zero and subtracted from the cost of the other options. Attendees discussed how the percentages of baseline were calculated. The cost rate was based on EPA guidance and was constant regardless of removal size. Mr. Gallagher noted on slide 15 how the slope break in the metric lines indicate how the 24-ac option provides the maximum cost benefit in terms of volume, mass, and C-max reduction.
- Slide 16 presents Conclusions regarding performance of the three removal options relative to the no removal option, based on the groundwater modeling. The 14-ac option offers no C-max reduction and limited reductions in volume and mass. The 24-ac option offers significant benefits in all three metrics. The 80-ac option produces incremental benefits relative to the 24-ac option, but at cost that is three times higher. The Army concludes that the 24-ac option is the optimum partial removal option to carry forward for evaluation in Alternative 2 of the FSSR.
- Slides 17 and 18 present the Army's proposed path forward and slide 19 presents a timeline. Step 1 is EPA and MassDEP agreement to proceed with the 14 FSSR alternatives as proposed, including the 24-ac soil removal option for the remaining partial source removal alternatives. Step 2 is to initiate technology screening and model runs for the FSSR. Step 3 is to provide updates during Tech Meetings of Technology Screening (weeks 4, 8, and 16), Interim Groundwater Modeling Results (week 12), and Final Groundwater Modeling Results (week 20). Step 4 (week 24) is to prepare the FSSR based on the input received during steps 1-3. Attendees agreed that this path forward appears to be reasonable to allow input and discussion by the stakeholders.

After Tech Meeting Items

Attendees discussed how to cover the two remaining scheduled topics, the Gun/Mortar Position RI scope and the Former K Range Draft RI, in the short time available at that point in the meeting. A discussion of risk assessment issues common to both topics ensued. These issues were discussed in a meeting on the draft Health and Environmental Risk Assessment (HERA) Workplan on Tuesday 2/14/06. The agreements reached in the 2/14/06 discussions were summarized as needed to allow discussion to proceed on the Gun/Mortar and Former K topics.

The risk presented by UXO needs to be considered in two different ways. The risk of physical harm will be addressed by summarizing existing documentation on the types/locations/density of UXO present and the access restrictions currently in place. The chemical risk needs to be addressed in the future and may include an estimate of the potential chemical release from UXO through corrosion and fate/transport mechanisms to be based on the results of studies currently underway at the Central Impact Area. EPA noted that it will not be possible to "close" sites until UXO risks are assessed and any required remediation is complete.

The issue of soil sample types was discussed. Multi-increment composite sampling is preferred for characterizing the ground surface. Sample collection for subsurface soil should consider site-specific release and transport mechanisms.

Chemical risk assessment methods were discussed at length. Data reduction steps prior to risk assessment were agreed on for ecological risk assessment. For human health, EPA does not want frequency of detection screening done prior to risk assessment. The threat of leaching to groundwater will be assessed initially by conservative SSLs, and subsequently by more realistic transport models. There is not complete agreement yet on model types and inputs. Chemicals (including TICs) will not be excluded from the risk assessment based on lack of a source release history (i.e., "mission relatedness"). The use of surrogate values for non-detects has not been resolved. The use of maximum concentrations between wells was resolved, and EPA requests a hypothetical "co-located" well that contains the maximum concentration for each analyte detected within a specified area/plume.

The Army will discuss leaching issues further with EPA's representative, Art Rood at INEEL. The timeframe for a Memorandum of Resolution (MOR) to address the HERA Workplan comments was not determined. This resolution will be needed before revisions to existing risk assessments, such as the Former K Range draft RI.

Former K Range Draft RI – Comment Resolution Meeting

The following responses from the IAGWSP's 1/6/06 Response to Comment Letter (RCL) on the EPA's 12/12/05 comments on the 11/3/05 draft Remedial Investigation report were discussed.

- General Comment 1a. EPA believes the range is larger than has been presented, and will send supporting documentation to IAGWSP. Jane Dolan (EPA) also indicated that the Army needs to consider results from MW-18, and should review historic aerial photos to better determine range boundaries.
- General Comment 1b. EPA requested that the draft documentation of UXO risk to safety be provided prior to the draft MOR; IAGWSP agreed to provide this.
- Specific Comments 3, 5, and 6 cannot be addressed until the HERA Workplan MOR is approved.

- Specific Comment 7. EPA requested more site-specific information, i.e., was hexavalent chromium an ingredient of munitions?
- The responses to Specific Comments 1, 2, 4, and 8-12 are acceptable to EPA.

MassDEP expects to be ready to discuss the 2/13/06 RCL on their 1/23/06 comments in one to two weeks. It was agreed that, pending completion of action items identified above, the status of the MOR could be revisited in about one month.

Gun/Mortar Position RI Scope of Work

Paul Nixon (IAGWSP) handed out copies of the data tables for six positions, which had been emailed on 2/10/06. Discussion ensued on the adequacy of the existing data for completing the RI and determining if remediation is required.

- Area 50 (Old GP-1). Marc Grant (AMEC) explained that the nitroglycerin detection was not mapped because the original detection had been resampled and was not detected in the second sample, though TNT was detected. A third sample at the original location did not detect either nitroglycerin or TNT. There was some discussion of whether all such results should be depicted on the current set of maps, which are only being used for evaluating additional delineation needs, or whether only the most recent results at each location should be depicted. This area is unusual in terms of having several grids with multiple sampling rounds. Carol Keating (EPA) asked that Army confirm that grid 50D had the maximum concentrations of DDT and breakdown products. Also, Ms. Keating indicated that Tech Memo 00-3 mentions (p. 40) a DNT detect in this area which is not mapped, therefore this discrepancy should be resolved. However, pending resolution of these issues, EPA generally believes there are sufficient samples at Area 50.
- Area 51 (GP-2). EPA generally believes there are sufficient samples at Area 51.
- Area 52 (Old GP-2). EPA recommends additional sampling for PEP between grids I, J, and K; also between grids K and M. Also, samples should be collected for dioxin and perchlorate. EPA requested documentation regarding any geophysical investigations at this position.

IART Meeting for February 2006

The EPA convened a meeting of the Impact Area Groundwater Review Team on February 28, 2006. The agenda included perchlorate and tungsten updates, 2006 meeting topics and membership updates, a Southeast Ranges Remediation and Investigation update, a Demolition Area 1 Groundwater Response Action annual update, Southeast Ranges and Demolition Area 2 Groundwater Monitoring Plans updates, and a Former K Range Remedial Investigation Groundwater Monitoring Plan update.

3. SUMMARY OF DATA RECEIVED

Validated data were received during February 2006 for Sample Delivery Groups (SDGs): E022106, E121905, SG0060, SG0070, SG0080, SG0085, SG0086, SG0093, SG0103, SG0104, SG0105, SG0106, SG0107, SG0108, SG0109, SG0111, SG0112, SG0113, SG0114, SG0115, SG0116, SG0117, SG0118, SG0119, SG0121, SG0122, SG0123, SG0166, and SG0168.

These SDGs contain results for 195 groundwater samples from supply, monitoring, and residential wells and 1 process water sample from the Frank Perkins Road ETR system.

Validated Data

Table 4 (sorted by analyte) summarizes the detections, since 1997, that equaled or exceeded an EPA Maximum Contaminant Level (MCL) or Health Advisory (HA) for drinking water, or equaled or exceeded a 4 ppb concentration for perchlorate. Table 4 is updated on a monthly basis; discussions in the text are updated on the same schedule as Figures 1 through 8, which are discussed later in this section.

Table 5 summarizes first-time validated detections of explosives below the MCL/HA for drinking water or of perchlorate below a 4 ppb concentration received from January 27, 2006 through February 24, 2006. First-time validated detections of VOCs, SVOCs, herbicides and pesticides are included and discussed quarterly in the March, June, September, and December Monthly Progress Reports. Metals, chloroform, and bis (2-ethylhexyl) phthalate (BEHP) are excluded from Table 5 for the following reasons: metals are a natural component of groundwater, particularly at levels below MCLs or HAs; detections of chloroform are pervasive throughout Cape Cod and are not likely the result of military training activities; and BEHP is believed to be largely an artifact of the investigation methods and introduced to the samples during collection or analysis.

Figures 1 through 8 depict the cumulative results of groundwater analyses for the period from the start of the Impact Area Groundwater Study (July 1997) to the present. Each figure depicts results for a different analyte class:

- Figure 1 shows the results of explosive analyses by EPA Method 8330. This figure is updated and included each month.
- Figure 2 shows the results of inorganic analyses (collectively referred to as "metals", though some analytes are not true metals) by methods E200.8, 300.0, 350.2M, 353M, 365.2, CYAN, IM40MB, IM40MBM, and IM40HG. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 3 shows the results of Volatile Organic Compound (VOC) analyses by methods OC21V, OC21VM, 504, 8021W, and SW8260 exclusive of chloroform detections. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 4 shows the chloroform results using the Volatile Organic Compound (VOC) analyses by method OC21V and OC21VM. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 5 shows the results of Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270, exclusive of detections of BEHP. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 6 shows the BEHP results using the Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 7 shows the results of Pesticide (method OL21P) and Herbicide (method 8151) analyses. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 8 shows the results of Perchlorate analysis by method E314.0. This figure is updated and included each month.

The concentrations from these analyses are depicted in Figures 1 through 7 compared to Maximum Contaminant Levels (MCLs) or Health Advisories (HAs) published by EPA for drinking water. For Figures 1 through 7, a red circle is used to depict a well where the concentration of one or more analytes was greater than or equal to the lowest MCL or HA for the analyte(s). A yellow circle is used to depict a well where the concentration of all analytes was less than the lowest MCL or HA. A green circle is used to depict a well where the given analytes were not detected in groundwater samples. For Figure 8, a red circle is used to depict a well where the concentration of perchlorate was greater than or equal to 4 ppb. An orange circle is used to depict a well where the concentration of perchlorate is above 1 ppb and below 4 ppb. A yellow circle is used to depict a well where the concentration of perchlorate was less than 1 ppb. A green circle is used to depict a well where perchlorate was not detected in groundwater samples. For all figures, an open circle is used to depict a proposed well where the analytes in question for example, Explosives in Figure 1, have not yet been quantified. A black circle represents a well that has been sampled for analytes, but validated groundwater data is not yet available.

There are multiple labels listed for some wells in Figures 1 through 8, which indicate multiple well screens at different depths throughout the aquifer. The aquifer is approximately 200 to 300 feet thick in the study area. Well screens are positioned throughout this thickness based on various factors, including the results of groundwater profile samples, the geology, and projected locations of contaminants estimated by groundwater modeling. The screen labels are colored to indicate which of the depths had the chemical detected above MCLs/HAs/4 ppb concentration for perchlorate. Generally, groundwater entering the top of the aquifer will move deeper into the aquifer as it moves radially outward from the top of the water table mound. Light blue dashed lines in Figures 1 through 8 depict water table contours. Groundwater generally moves perpendicular to these contours, starting at the center of the 70-foot contour (the top of the mound) and moving radially outward. The rate of vertical groundwater flow deeper into the aquifer slows as groundwater moves away from the mound.

The results presented in Figures 1 through 8 are cumulative, which provides a historical perspective on the data rather than a depiction of current conditions. Any detection at a well that equals or exceeds the MCL/HA/4 ppb concentration for perchlorate results in the well having a red symbol, regardless of later detections at lower concentrations, or later non-detects. The difference between historical and current conditions varies according to the type of analytes. There are little or no differences between historical and current exceedances of drinking water criteria for Explosives, Perchlorate, VOCs, Pesticides, and Herbicides; the minor differences are mentioned in the following paragraphs. There are significant differences between historical and current exceedances of drinking water criteria for Metals and SVOCs, as described further below.

Figure 1: Explosives in Groundwater Compared to MCLs/HAs

For data validated in February 2006, one well, MW-247M3 (J-3 Range), had a first-time validated detection of RDX above the HA of 2 ppb. One well, MW-232M1 (J-3 Range), had a first-time validated detection of RDX below the HA of 2 ppb.

Exceedances of drinking water criteria for explosive compounds are indicated in six general areas:

- Demo Area 1 (wells 19, 31, 34, 73, 76, 77, 114, 129, 165, 210, and 211);
- Demo Area 2 (wells 16, 160, 259, 262, and 404);

- The Impact Area and CS-19 (wells 58MW0001, 58MW0002, 58MW0009E, 58MW0011D, 58MW0016B, 58MW0016C, 58MW0018B; and wells 1, 2, 23, 25, 37, 38, 40, 43, 85, 86, 87, 88, 89, 90, 91, 93, 95, 98, 99, 100, 101, 105, 107, 111, 112, 113, 176, 178, 184, 201, 203, 204, 206, 207, 209, 223, 235, OW-1, OW-2, and OW-6);
- J Ranges and southeast of the J Ranges (wells 45, 58, 130, 132, 147, 153, 163, 164, 166, 171, 191, 196, 198, 215, 218, 227, 234, 247, 265, 289, 303, 306, 324, 326, 343, 346, 360, 368, 398, and wells 90MW0022, 90MW0041, 90MW0054 and 90WT0013).
- Landfill Area 1 (wells 27MW0018A, 27MW0020A, and 27MW0020B); and
- Northwest Corner of Base Boundary (well 323)

Exceedances of drinking water criteria were measured for TNT at Demo Area 1 (wells 19S, 31S, 31M, and 31D) and Southeast of the Ranges (196S). Exceedances of the HA for RDX were noted at all of the locations listed above except at MW-45, MW-196, and the LF-1 wells. Exceedances of drinking water criteria were measured for 2,6-dinitrotoluene (2,6-DNT) at MW-45S. Exceedances of drinking water criteria were measured for 1,3-dinitrobenzene at LF-1 wells 27MW0018A, 27MW0020A and 27MW0020B.

Demo Area 1 has a single well-defined source area and extent of contamination. The estimated extent of RDX exceeding the HA at Demo Area 1 based on the most recent groundwater measurements is indicated by a magenta concentration contour line on Figure 1 and Inset A.

Demo Area 2 has five groundwater exceedances of the RDX HA at MW-16S, MW-160S, MW-259, MW-262M1, and MW-404M2. The extent of the contamination is currently under investigation.

The Impact Area has a plume defined by RDX concentrations above the HA of 2 ppb. The plume originates primarily along Turpentine Road and extends downgradient to the east, northeast. Another source of RDX in the Impact Area is CS-19. Portions of CS-19 are currently under investigation by the Air Force Center for Environmental Excellence (AFCEE) under the Superfund program. The extent of RDX has largely been defined in the Impact Area and the investigation phase of the project is nearing completion.

The J Ranges and downgradient areas have five groundwater plumes defined by concentrations of RDX above the HA of 2 ppb. The five plumes originate at the J-1 Range Interberm Area (northern plume in the vicinity of MW-58 and MW-265), the J-2 Range North plume (northern plume extending from MW-130), the J-2 Range East plume (eastern plume including MW-215), the J-3 Range Demolition Area (southern plume extending from MW-163 south to Snake Pond) and the L Range (in an area defined by MW-147 and MW-153 at Greenway Road). All the J ranges and the L Range are currently under investigation and the plumes will be updated and refined as new validated data is received.

The Northwest Corner of the base boundary has one validated detection of RDX in groundwater above the HA of 2 ppb at MW-323M2. The M1 screen in this location has a validated detection of RDX in groundwater below 2 ppb.

Figure 2: Metals in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for metals are scattered throughout the study area. Where two or more rounds of sampling data are available, the exceedances generally have not been replicated in consecutive sampling rounds. The exceedances have been measured for antimony, arsenic, cadmium, chromium, lead, molybdenum, sodium, thallium and zinc. Arsenic

(well 7M1), cadmium (52M3), and chromium (7M1) each had one exceedance in a single sampling round in August-September 1999. Two of four lead exceedances (ASP well and 45S) were repeated in another sampling round and the remaining two lead exceedances (wells 2S and 7M1) have not been repeated in previous or subsequent results. Two of the eight molybdenum exceedances were repeated in consecutive sampling rounds (wells 53M1 and 54S). All of the molybdenum exceedances were observed in year 1998 and 1999 results. Seven of the 19 sodium exceedances were repeated in consecutive sampling rounds (wells 2S, 46S, 57M2, 57M1, 145S, ASP well and SDW261160). Eight wells (21S, 57M1, 57M3, 144S, 145S, 148S, 187D, and the ASP well) had sodium exceedances in year 2002, 2003, and/or 2004 results. Zinc exceeded the HA in seven wells, all of which are constructed of galvanized (zinc-coated) steel.

There have been few exceedances of drinking water limits for antimony and thallium since the introduction of the ICP/GFAA and ICP/MS methods, discussed in the next paragraph. None of the 12 antimony exceedances were repeated in consecutive sampling rounds, and only one exceedance (well 187D) was measured in year 2002 results. Eight of the 71 thallium exceedances were repeated in consecutive sampling rounds (wells 7M1, 7M2, 47M2, 52S, 52D, 54S, 54M1, and 94M2). Only two wells (148S and 191M1) have had thallium exceedances in the year 2002. There have been no exceedances of thallium in 2003, 2004 or thus far in 2005.

Groundwater samples sent for metals analysis are analyzed for most metals by Inductively Coupled Plasma (ICP) in accordance with U.S. EPA Contract Laboratory Program Statement of Work ILM04.0. In May of 2001, the IAGWSP began analyzing for antimony and thallium using the GFAA (graphite furnace atomic adsorption) method in accordance with EPA Drinking Water Methods 204.2 (antimony) and 279.2 (thallium) in order to achieve lower detection limits for these metals. Both the ILM04.0 and GFAA methods are subject to false positive results at trace levels due to interferences. As a result, the IAGWSP changed to a new method to achieve lower detection limits for antimony and thallium in January of 2003. Groundwater samples are now analyzed for antimony and thallium by Inductively Coupled Plasma/Mass Spectroscopy (ICP/MS) in accordance with the EPA Method 6020. The ICP/MS Method 6020 has greater sensitivity and the added feature of selectivity for antimony and thallium. These additional methods achieve lower detection limits for these two metals and reduce the number of false positive results.

The distribution and lack of repeatability of the metals exceedances is not consistent with a contaminant source, nor do the detections appear to be correlated with the presence of explosives or other organic compounds. The IAGWSP has re-evaluated inorganic background concentrations using the expanded groundwater quality database of 1999, and has submitted a draft report describing background conditions. The population characteristics of the remaining eight metals were determined to be consistent with background.

Figure 3: VOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for VOCs are indicated in six general areas: Northeast Corner (LRMW003), CS-10 (wells 03MW0007A, 03MW0014A, and 03MW0020), LF-1 (well 27MW0017B), FS-12 (wells MW-45S, 90MW0003, and ECMWSNP02D), and in the J-1 Range (187D). CS-10, LF-1, and FS-12 are sites located near the southern extent of the Training Ranges that are currently under investigation by AFCEE under the Superfund program. Exceedances of drinking water criteria were measured for tetrachloroethylene (PCE) at CS-10, for vinyl chloride at LF-1, and for methylene chloride, toluene, 1,2-dichloroethane, and ethylene dibromide (EDB) at FS-12. These compounds are believed to be associated with the sites

under investigation by AFCEE. Detections of benzene, tert-butyl methyl ether, and chloromethane at J-1 Range well 187D and chloromethane at Northeast Corner well LRMW003 are currently under investigation.

Figure 4: Chloroform in Groundwater Compared to MCLs

Chloroform has been widely detected in groundwater across the Upper Cape as stated in a joint press release from USEPA, MassDEP, IRP, and the Joint Programs Office. The Cape Cod Commission (2001) in their review of public water supply wells for 1999 found greater than 75% contained chloroform with an average concentration of 4.7 ug/L. The IRP has concluded chloroform is not the result of Air Force activities. A detailed discussion of the presence of chloroform is provided in the Final Central Impact Area Groundwater Report (06/01). To date, the source of the chloroform in the Upper Cape groundwater has not been identified.

Figure 5: SVOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for SVOCs are scattered throughout the study area. All exceedances of drinking water criteria for SVOCs were measured for bis (2-ethylhexyl) phthalate (BEHP), with the exception of two wells. MW-264M1 (J-3 Range) had a detection of benzo(a)pyrene at concentrations of more than twice the HA and MW-241M1 (L Range) had a detection of naphthalene above the HA of 100 ppb. Detections of BEHP are presented separately in Figure 6 and discussed in the next paragraph.

Figure 6: BEHP in Groundwater Compared to MCLs

Exceedances of drinking water criteria for bis (2-ethylhexyl) phthalate (BEHP) are scattered throughout the study area. BEHP is believed to be largely an artifact of the investigation methods, introduced to the samples during collection or analysis. However, the potential that some of the detections of BEHP are the result of activities conducted at MMR has not been ruled out.

A detailed discussion of the presence of BEHP is provided in the Draft Completion of Work Report (7/98) and subsequent responses to comments. The theory that BEHP mostly occurs as an artifact, and is not really present in the aquifer, is supported by the results of subsequent sampling rounds that show much lower levels of the chemical after additional precautions were taken to prevent cross-contamination during sample collection and analysis. Only four locations (out of 90) showed BEHP exceedances in consecutive sampling rounds: 28MW0106 (located near SD-5, a site under investigation by AFCEE), 58MW0006E (located at CS-19), and 90WT0013 (located at FS-12), and 146M1 (located at L Range). Subsequent sampling rounds at all these locations have had results below the MCL. Eleven wells (27MW0705, 27MW2061, C2-B, C6-C, C7-B, 47M2, 164M1, 168M1, 188M1, 196M1, and 198M1) had BEHP exceedances in the year 2002 and 2003 results. There have been no exceedances of BEHP in 2004 and one exceedance of BEHP, at MW-356M1 (J-3 Range), in 2005.

Figure 7: Herbicides and Pesticides in Groundwater Compared to MCLs/HAs

There has been one exceedance of drinking water criteria for pesticides, at well PPAWSMW-1. A contractor to the United States Air Force installed this monitoring well at the PAVE PAWS radar station in accordance with the Massachusetts Contingency Plan (MCP), in order to evaluate contamination from a fuel spill. The exceedance was for the pesticide dieldrin in a sample collected in June 1999. This well was sampled again in November 1999. The results of

the November sample indicate no detectable pesticides although hydrocarbon interference was noted. It appears from the November sample that pesticides identified in the June sample were false positives. However, the June sample results cannot be changed when following the EPA functional guidelines for data validation. The text of the validation report for the June sample has been revised to include an explanation of the hydrocarbon interference and the potential for false positives.

There has been one exceedance of drinking water criteria for herbicides, at well 41M1 (Impact Area). This response well was installed downgradient of the Impact Area. The exceedance was for the herbicide pentachlorophenol in a sample collected in May 2000. There were no detections above the MCL of this compound in the three previous sampling rounds in 1999, nor in the subsequent sampling rounds in 2000, 2001, 2002, and 2003.

Figure 8: Perchlorate in Groundwater Compared to a 4 ppb Concentration

For data validated in February 2006, no wells had first-time validated detections of perchlorate above the concentration of 4 ppb. Three wells, 58MW0010B, 58MW0016A (CS-19), and MW-94M1 (Impact Area) had first-time validated detections of perchlorate below the concentration of 4 ppb.

Sampling and analysis of groundwater for perchlorate was initiated at the end of the year 2000 as part of the IAGWSP. Exceedances of the 4 ppb concentration of perchlorate are indicated in six general areas:

- Demo Area 1 (wells 19, 31, 32, 34, 35, 36, 73, 75, 76, 77, 78, 114, 129, 139, 162, 165, 172, 210, 211, 225, 258 and 341);
- Impact Area (well 91);
- J Ranges and southeast of the J Ranges (wells 127, 130, 132, 143, 163, 193, 197, 198, 232, 243, 247, 250, 263, 265, 286, 289, 293, 300, 302, 303, 305, 307, 310, 313, 321, 326, 339, 346, 348, 368, 370, and wells 90PZ0211, 90MW0022 and 90MW0054);
- Landfill Area 1 (27MW0031B);
- CS-18 (well 16MW0001); and
- Northwest Corner of Base Boundary (wells 4036009DC, 270, 277, 278, 279, 284, and 309).

Demo Area 1 has a single well-defined source area and extent of contamination. The downgradient extent of the perchlorate plume has been determined with the installation of monitoring wells along the power line right-of-way east of Fredrickson Road.

The Impact Area has a single exceedance of the 4 ppb concentration of perchlorate at MW-91S.

Plumes have been identified in four areas in the J Ranges as shown on Figure 8. The J-1 Interberm perchlorate plume has several detections of greater than 4 ppb in downgradient locations MW-265, MW-286, MW-303, MW-326, MW-346, and MW-370. The J-3 Range Demolition perchlorate plume has concentrations greater than 4 ppb in several wells immediately downgradient of the source area, which is centered at MW-198, and further downgradient centered around location 90MW0054. The J-2 Range North perchlorate plume has detections greater than 4 ppb at source area locations MW-130 and MW-263, and downgradient locations MW-289, MW-293, MW-300, MW-302, MW-305, and MW-313. The J-2 East perchlorate plumes are in the process of delineation and include detections greater than 4 ppb at MW-307, MW-310 and MW-368. Perchlorate detections at the L Range are below 4 ppb and a plume is not depicted on the figure.

The Northwest Corner has a perchlorate plume extending from Canal View Road at the base boundary to the Cape Cod Canal. This area is under investigation and the plume will be updated and refined as new data is received.

The LF-1 and CS-18 areas are under investigation by AFCEE in the Superfund Program.

Rush (Non-Validated) Data

Rush data are summarized in Table 6. These data are for analyses that are performed on a fast turnaround time, typically 1 to 10 days. Explosive analyses for monitoring wells, and explosive and VOC analyses for profile samples, are typically conducted in this timeframe. Other types of analyses may be rushed depending on the proposed use of the data. The rush data have not yet been validated, but are provided as an indication of the most recent preliminary results. Table 6 summarizes only detects, and does not show samples with non-detects.

The status of the detections with respect to confirmation using Photo Diode Array (PDA) spectra is indicated in Table 6. PDA is a procedure that has been implemented for the explosive analysis, to reduce the likelihood of false positive identifications. Where the PDA status is "YES" in Table 6, the detected compound is verified as properly identified. Where the status is "NO", the identification of an explosive has been determined to be a false positive. Where the status is blank, PDA has not yet been used to evaluate the detection, or PDA is not applicable because the analyte is a VOC. Most explosive detections verified by PDA are confirmed to be present upon completion of validation.

Rush data received during February was non-detect for all analytes, therefore Table 6 is not included in this report.

4. DELIVERABLES SUBMITTED

Deliverables submitted during the reporting period include the following:

Monthly Progress Report # 106 for January 2006	02/09/2006
Final Thermal Treatment Unit Completion Report	02/10/2006
Draft Non-Specific and Small Operable Unit Interim Groundwater Monitoring Plan	02/10/2006
Draft Northwest Corner Remedial Investigation Report	02/15/2006
Interim Month Report for February 1-10, 2006	02/17/2006

5. SCHEDULED ACTIONS

Figure 9 provides a Gantt chart updated as of December 4, 2005 to reflect progress and proposed work. The following documents are scheduled to be submitted in March and early April:

- Demo 1 Soil Final Rapid Response Action Completion of Work Report
- J-1 Range Final Interim Groundwater Monitoring Plan
- J-2 Range Soil Final Rapid Response Action Completion of Work Report
- J-2 Range East Final Interim Groundwater Monitoring Plan
- L Range Soil Final Remedial Investigation Report
- L Range Final Interim Groundwater Monitoring Plan

- Central Impact Area Targets 23 and 42 Soil Final Rapid Response Action Completion of Work Report
- Northwest Corner Final Interim Groundwater Monitoring Plan
- Demo 2 Final Interim Groundwater Monitoring Plan
- Gun and Mortar Draft Groundwater and Soil Remedial Investigation Workplan
- Gun and Mortar Final Interim Groundwater Monitoring Plan
- Former K Range Final Interim Groundwater Monitoring Plan
- Ammunition Supply Point Final Rapid Response Action Workplan
- BA-1 Training Area Soil Final Completion of Work Letter Report
- Wide Area Source Assessment Final Generic Workplan

The following documents are being prepared or revised during March and early April:

- J-1 Range Groundwater Draft Remedial Investigation Report
- J-1 Range Groundwater Draft Rapid Response Action Plan
- J-2 Range Groundwater Draft Remedial Investigation Report
- J-3 Range Soil Final Remedial Investigation Report
- J-3 Range Soil Draft Feasibility Study
- J-3 Range Groundwater Draft Remedial Investigation Report
- L Range Groundwater Draft Risk Assessment Report
- Central Impact Area Soil Final Remedial Investigation Report
- Central Impact Area Soil Revised Draft Focused Investigation Report
- Central Impact Area Soil and Groundwater Draft Feasibility Study Screen Report
- Central Impact Area Groundwater Final Remedial Investigation Report Addendum
- Western Boundary Draft Remedial Investigation Report
- Northwest Corner Final Remedial Investigation Report
- Demo 2 Groundwater Draft Remedial Investigation Report
- Former A Range Draft Remedial Investigation Report
- Phase 2b Sites Final Remedial Investigation Report
- Small Arms Range Draft Remedial Investigation Report
- Small Arms Range Final Rapid Response Action Workplan
