MONTHLY PROGRESS REPORT #115
FOR OCTOBER 2006

EPA REGION I ADMINISTRATIVE ORDERS SDWA 1-97-1019 and 1-2000-0014

MASSACHUSETTS MILITARY RESERVATION
TRAINING RANGE AND IMPACT AREA

The following summary of progress is for the period from October 1 to October 31, 2006. Scheduled actions are for the six-week period ending December 15, 2006.

1. SUMMARY OF REMEDIATION ACTIONS

The following is a description of remediation actions underway at Camp Edwards as of October 27, 2006. Remediation actions may include Rapid Response Actions (RRA). An RRA is an interim action that may be conducted prior to risk assessments or remedial investigations to address a known, ongoing threat of contamination to groundwater and/or soil.

Demo Area 1 Groundwater RRA

The Demo Area 1 Groundwater RRA consists of the removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. Extraction, treatment, and recharge (ETR) systems at Frank Perkins Road and Pew Road include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Pew Road ETR continues operation at a flow rate of 100 gallons per minute (gpm). As of October 27, 2006, approximately 107 million gallons of water have been treated and re-injected at the Pew Road ETR System.

The Frank Perkins Road ETR continues operation at a flow rate of 330 gpm. As of October 27, 2006, approximately 233 million gallons of water had been treated and re-injected at the Frank Perkins Road ETR System.

Demo Area 1 Comprehensive Groundwater Remedial Action

The final remedy for Demo Area 1 groundwater will increase total flow to a rate of 906 gpm from five extraction wells, three of which will be new construction, with recharge of treated water via four injection wells. The Pew Road ETR system will remain in place, and the Frank Perkins Road temporary ETR System will be replaced by a permanent treatment facility.

During the month of October, the following work was performed: Completed placement of concrete for the foundation footings, the trench drain bases and walls, the sump pit base and walls, and the concrete masonry unit wall footings. Completed installation of rebar for the trench drain walls. Continued forming and placing of rebar for the building foundation.

J-2 Range Groundwater RRA

The J-2 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and infiltration basins to return treated water to the aquifer.

During the month of October, the following work was performed: Completed construction punch list activities. The ETR continues operation at a flow rate of 375 gpm.

J-3 Range Groundwater RRA

The J-3 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater and use of the existing Fuel Spill-12 (FS-12) infiltration gallery to return treated water to the aquifer.

During the month of October, the following work was performed: Completed construction punch list activities. The ETR continues operation at a flow rate of 175 gpm.

2. SUMMARY OF ACTIONS TAKEN

Drilling progress for the month of October is summarized in Table 1.

Table 1. Drilling progress as of October 31, 2006

Boring Number	Purpose of Boring/Well	Total Depth (ft bgs)	Depth to Water Table (ft bgs)	Completed Well Screens (ft bgs)
MW-468	Echo Range (MW-1)	182	172	170-180
MW-469	Ammunition Supply Point (MW-1)	142	102	129-139
MW-470S	Golf Range (MW-1)	88	78	76-86
MW-471S	Juliet Range (MW-1)	97	86	85-95
MW-472S	Juliet Range (MW-2)	98	88	86-96
MW-473S	Kilo Range (MW-1)	95	85	83-93
MW-474S	Kilo Range (MW-2)	99	88	86-96
MW-475S	Former B Range (MW-1)	64	53	50-60
MW-476S	Former B Range (MW-2)	72	61	59-69
ft bgs = ft below ground surface				

Samples collected during the reporting period are summarized in Table 2. Completed drilling and well installation at MW-468, MW-469, MW-470S, MW-471S, MW-472S, MW-473S, MW-474S, MW-475S, and MW-476S.

Groundwater samples were collected from recently installed wells at Echo Range, Ammunition Supply Point, Golf Range, Juliet Range, Kilo Range, Former B Range, Tango Range and from a drive point location at the Ammunition Supply Point. Groundwater samples were collected in accordance with the Interim Groundwater Monitoring Plans (GMPs) for 2006 at the Central Impact Area (CIA), J-1 Range, J-2 Range, Former A Range, Northwest Corner, and "Other" locations. Post Blown in Place (BIP) excavation confirmation soil samples were collected at the CIA, J-1 Range, J-2 Range. Supplemental soil samples were collected at Blown in Place (BIP) locations at the J-1 Range in accordance with the BIP Sampling and Analysis Plan. Soil samples were collected from drive point locations in the CIA. Rinsate samples were collected in the CIA for the 155 mm Flux Study. Soil samples were collected at the former munitions survey program (MSP) sub-polygons in the J-2 Range. Surface water samples were collected near a public beach, a private beach, and near the spit at Snake Pond.

The following bullets summarize the BIP items for the month of October. The pre- and post-BIP sample collection dates are shown:

- Impact Area:
  October 5/5, 2006: One (1) 155 mm mortar at Test Plot H-2
  October 12/12, 2006: One (1) 81 mm mortar at Test Plot M-1
  October 17/18, 2006: Three (3) 4.2 inch mortars at Test Plot H-1
  October 17/18, 2006: Two (2) 81 mm mortars at Test Plot L-1
  October 17/18, 2006: One (1) 81 mm mortar at Test Plot H-1
  October 25/26, 2006: Two (2) 81 mm mortars at Test Plot M-1
  October 25/26, 2006: One (1) 105 mm mortars at Test Plot M-1
- J-1 Range:
  October 17/18, 2006: One (1) 105 mm projectile at Grid K67
  October 17/18, 2006: Two (2) 105 mm projectile at Grid K66
  October 26/26, 2006: One (1) 105 mm projectile at Grid I68

Pre- and post-BIP samples, summarized in Table 2, were collected in accordance with the sampling protocol.

Anomaly investigation as part of the Impact Area Post Screening Investigation (PSI) continued. Tables 3A, 3B, 3C, 3D, 3E, and 3F show the grid summary for Test Plots H-1, H-2, L-1, L-2, M-1, and M-2, respectively.

J-1 Range Supplemental Geophysical Anomaly Investigation continued at grids I66, I67, I68, I69, J7, J22, J68, J70, J71, K26, K62, K66, K67, K72, and L69. Table 4 shows a grid sheet summary for excavation and munitions recovered for the J-1 Range Supplemental Geophysical Anomaly Investigation for the period ending October 27, 2006.

The controlled detonation chamber (CDC) was mobilized to the site, and is expected to begin detonation operations in November. The CDC will be on-site for approximately six weeks.

The following are the notes from the September 28, 2006 Technical Team meeting of the Impact Area Groundwater Study Program office at Camp Edwards

<u>Southeast Ranges</u>

<u>J-3 RI/FS Modeling Options/RRA Scenarios</u>

Mr. Goydas (ECC) introduced the first slide of remedial action objectives for J-3 Range Groundwater. The objectives are to restore the usable groundwater to its beneficial use within a reasonable timeframe and to prevent potential ingestion, inhalation, and dermal contact with groundwater containing COPCs in excess of federal maximum containment levels (MCLs), HAs, drinking water equivalent levels (DWELs), applicable state standards, and/or an unacceptable excess lifetime cancer risk or non-cancer Hazard Index. The next slide showed the current arrangement of chemical monitoring locations.
Len Pinaud (MassDEP) asked to have the remedial action objectives researched to determine if it should say “COPCs in excess of federal and state MCLs?” This should be consistent with Demo 1.

The J-3 Range Groundwater Alternatives being evaluated by the FS are: Alternative 1-No action; Alternative 2-No action but would include long-term monitoring plus institutional controls; Alternative 3a-Continue to operate under present flow rates, maintain, and monitor the J-3 RRA

system plus institutional controls and referred to as "status quo" alternative; Alternative 3b-Continue to operate, maintain, and monitor the J-3 RRA system with increased in-plume pumping plus institutional controls and referred to as "status quo optimized"; Alternative 4-Continue to operate, maintain, and monitor the J-3 RRA system plus institutional controls plus additional leading edge groundwater extraction and referred to as "status quo plus additional extraction downgradient well"; Alternative 5-Continue to operate, maintain, and monitor the J-3 RRA system plus institutional controls plus increased pumping plus additional extraction well and referred to as "status quo optimized plus additional in-plume well"; and Alternative 6-Continue to operate, maintain, and monitor the J-3 RRA system plus institutional controls plus additional in-plume extraction and referred to as "aggressive pumping".

Slide #7 showed the differences between modeling FS and RRA: The same SE Ranges model was used for both; low conductivity units located refined near source area have been area modified (MW-163 and MW-343); contaminant mass distribution within the refined model (removed from select low conductivity units) because the data didn't match the first and latest package; perchlorate modeled to MMCL of 2 ug/L. EPA asked why the model wasn't run to ND; and that is because the objective was to model to 2. Monitoring Wells 163 and 343 removed mass to approximately 1 or 2 ug/L. EPA noted it is necessary to state in the FS how long it will take to get to background, regulatory standard, and the risk-based standard.

Slide #8 - Low conductivity deposits refined. The model conductivities refined to match more current stratigraphic interpretation; in area upgradient of in-plume extraction well; lowered tops of upper surface of silt units between minimum of 5 to maximum of 40 feet. For example, local hydraulic conductivities are 235 ft/day for sand and < 35 ft/day for silt.

Slide #9 – Mass removed from low K deposits. Mass was removed from low K units to match data from fixed wells in the low K units; this was done because transport velocities in deeper portion of the plume were slower than interpreted from field data.

<u>Alternatives Evaluation</u>
All alternatives assume 2004 FS-12 pumping rates for 2004 and 2005;
All alternatives assume 2005 FS-12 pumping rates from 2005 through 2030;
Alternatives 3a, 3b, 4 through 6 assume start up in September 2006. This date was used for simplification of the model.

Alternatives 1 and 2 assume ambient conditions.

Alternative 3a (status quo) – Assumes current status quo pumping rate (extraction well 001 @ 50 gpm, extraction well 032 @ 65 gpm, and in-plume well @ 60 gpm for a total of 175 gpm). Slide #12 shows the existing extraction location and detections of perchlorate and RDX for Alternative 3a.

Alternative 3b (status quo optimized) – Assumes optimized status quo pumping rate (extraction well 001 @ 50 gpm, extraction well 032 @ 65 gpm, and in-plume well @ 100 gpm [above current level] for a total of 215 gpm).

Alternative 4 - Assumes current status quo pumping rate (extraction well 001 @ 50 gpm, extraction well 032 @ 65 gpm, and in-plume well @ 60 gpm for a total of 175 gpm); additional downgradient well located northwest of Snake Pond (pumping rate @ 60 gpm). This well is initialized in July 2009 (2 years after signing of the ROD to allow for design and construction).

The total pumping rate for this alternative is 235 gpm. Slide #15 shows the existing extraction location and detections of perchlorate and RDX for Alternative 4.

Alternative 5 – Assumes optimized status quo pumping rate (extraction well 001 @ 50 gpm, extraction well 032 @ 65 gpm, and in-plume well @ 100 gpm for a total of 215 gpm); additional in-plume extraction well north of J31P001 (pumping rate @ 45 gpm) and lowered pumping rate for 90EW001 (30 gpm) with changes initialized in July 2009; total pumping rate @ 240 gpm which is within the 250 gpm plan capacity; and assumes new in-plume well shut down in 2019 to reduce stagnation zone between the new and current in-plume wells. Alternative 5 works within the present capacity of the plant. Slide #17 shows the existing extraction location and detections of perchlorate and RDX for Alternative 5.

Alternative 6 – Implements optimized status quo pumping rates for RRA system (extraction well 001 @ 50 gpm, extraction well 032 @ 65 gpm, and in-plume well @ 100 gpm) through 2009; additional in-plume extraction well north of J31P001 (pumping rate @ 100 gpm) which is initialized in July 2009; status quo system modified in July 2009 (90EW0001 @ 30 gpm, J3EW0032 @ 65 gpm, J31P001 @ 250 gpm); total pumping rate for this scenario is 445 gpm. Slide #19 shows the existing extraction location and detections of perchlorate and RDX for Alternative 6.

Slide #20 shows the perchlorate mass capture and discharge for Alternatives 1 through 6 with total flow rate (gpm); perchlorate mass removed (kg); perchlorate mass discharged to Snake Pond (kg); year to all EWs below MDL; and year to remove 99% extractable mass. EPA again noted it is necessary to state in the FS the time it will take to restore to 0.35 for perchlorate (background). EPA also requested another column indicating the restoration year.

Slides #21 through #23 show, by alternative, perchlorate mass removal, perchlorate mass discharge to Snake Pond, and perchlorate volume reduction.

Slide #24 shows the RDX mass capture and discharge for Alternatives 1 through 6 with total flow rate; RDX mass removed; RDX mass discharge to Snake Pond; year to all EWs below MDL; and year to remove 99% extractable mass. EPA requested the last column to show the year to achieve asymptotic mass removal.

Slides #25 through #27 show, by alternative, RDX mass removal, RDX mass discharge to Snake Pond, and RDX volume reduction.

Slides #28 through #33 presented 100 year animations for each alternative for perchlorate and RDX.

<u>Summary</u>
This presentation is a preview of what will be presented in the upcoming FS; all alternatives presented will be subjected to detailed analysis.

EPA noted the alternatives shown represent an appropriate range; the RAO's may need to be adjusted, and the comparison data needs to be included in the analysis.

EPA requires the presentation of a comparison of alternatives be included in the FS. If this is not included in the FS, it will be a fatal flaw and a disapproval will be submitted.

EPA asked for the total flow rate of each alternative to be shown on the figure.

EPA requested the original plume shell data be resent, the basis for maps, and the presentation be sent electronically to EPA and Mass DEP.

J-2 Study Area 3, Soil RI Presentation

This is the last presentation on the J-2 Range, Study Area 3, which also encompasses a portion of the N Range that is in the boundary of the J-2 Range. The investigation focused on the features and discoveries through groundwater data.

Mr. Gangopadhyay (ECC) introduced two figures – J-2 Range Area Overview that focuses on Area 3 and J-2 Area 3 Features.

Study Area 3 Background Information – Small arms/rifle range (N Range) 30's to 60's; Contractor range 60's through 80's used for testing of various munitions, contractor area (offices, ammunition storage, melt/pour area, fixed firing points).

Study Area 3 Features Investigated and Sampled – Fixed firing points 1 and 2, Berm 1, latrine/soil piles, loading/conditioning/conex area, melt/pour area, drop tower, and ammo supply magazine.

The next two slides are figures of the J-2 Area 3 MEC Cleared Area and J-2 Area 3 Additional Targets (17 additional targets).

MEC Clearance Summary – MEC clearance was conducted during MSP (polygon investigations), well pad and road clearance, supplemental geophysical investigations, and additional targets based on discrimination analysis. MEC cleared in Area 3 is 47,680 sq. ft.; remaining surfaced with signal response (> 3 mV) is 69,283 sq. ft. Approximately 40% of signal response area has been MEC cleared and discovered MEC/MD/RRD has been removed.

MEC discovery summary, listed in order of quantity, is:
3.5" rockets = 61 items (59 found at single location at N Range, none were cracked or leaking); NOS objects = 47 items mostly CAD and PYR, 18 shock tubes found at the N Range; 60mm = 37 items, mostly disposed in burial pits; 66mm = 29 items (includes 23 fused launchers at single location in N Range); and 30mm = 22 items (mostly cartridge cases). Observations made in discoveries include: 199 MEC items discovered (100 within the N Range in a disposal area); 53 items found in burial pits in Grid J16 three small MEC burial pits; less than 3% of all items were found cracked and/or leaking (none of the N Range items were cracked or leaking); 85 of 99 MEC items within Study 3 found in 3 burial locations; approximately 4% of burial pit MEC items in Area 3 cracked and/or leaking; three 30mm HEI rounds found in M17.

The next two slides are figures showing locations of J-2 Area 3 MEC items and MD/RRD items.

MEC clearance summary observations: isolated MEC burials in 3 locations I16, J16, H17 and K11); MEC discoveries mostly included items that were tested at J-2 Range (66mm, 60mm, etc.); miscellaneous MEC items such as propellants, CADs also found in burial pits; MD/RRD burials more wide spread within this area; MD included items or parts that were not tested at J-2.

Summary – MEC Discoveries Conclusions

Complete geophysical coverage of the J-2 Range based on 1977 aerial. MEC clearance targeted at locations identified through background information and witness interviews, site recon, geophysical signals, modeling and previous investigations.

In the area primarily used as a contractor area for administration-type activities, MEC clearance finds suggests disposal of MD/RRD items. Disposal also included few MEC items found in three burial locations.

MEC items disposed were mostly from testing activities; burial pits had the highest detections of explosives and perchlorate.

Mr. Gangopadhyay pointed out the two Sky identified targets that were not investigated.

The next slide contains a table of the total number of samples grouped by analyte and depth (0-1 foot and > l foot); and the statistics of RDX and perchlorate. For RDX, the maximum is 540 ppb excavated soil from burial pit in I16; deepest samples collected is 32 feet; deepest detect is 540 ppb excavated from burial pit in I16; and the maximum (in-situ) is 220 ppb-discrete soil sample in I14 melt/pour area. For perchlorate, the maximum is 10.4 ppb excavated soil from burial pit in I16; deepest sample collected is 6.25 feet; deepest detect is 10.4 ppb (0-5 feet composite) in burial pit in I16; and the maximum (in-situ) is 4.88 ppb, composite soil sample in M15.

The next slide is a figure that shows J-2 Area 3 soil sample locations, broken into surface (0-1 feet bgs) and sub-surface (>1 feet bgs) samples.

The next slide contains a table of the remaining samples grouped by analyte and depth. The next slide contains two tables of preliminary screening results grouped by analyte, and by samples exceeding screening criteria and samples exceeding screening criteria other than SSL. Note that this screening is preliminary; risk and leaching assessment to be conducted during the RI will determine clean-up standards.

Analytical data observations and conclusions are: sample locations are co-located with areas of interest defined by witness interviews, site recon, geophysical signals, MEC discoveries ad site features. Sample collection in these areas is adequate to describe nature and extent, define the source areas and initiate the RI; analytical results define the vertical extent of contamination; quantity of samples and suite of analytes are sufficient to support risk and leaching assessments; did see highest concentrations associated with burial location, relic concentration also observed in the melt/pour building foundation area; the highest detections of perchlorate and RDX are co-located.

The next slide is a figure of the J-2 East 2006 plume shells. The source characteristics inferred from plume characteristics are the eastern lobe is detached from source area; one likely source for the eastern plume is perchlorate remains in the aquifer and there is no residual RDX in that portion of the aquifer. The initial release was likely approximately 40 years ago. Other sources may have contributed to the eastern portion of the central plume lobe. There is little or no continued release from sources. It appears some of the burial pits (I16 area) may have in the past contributed to the eastern portion of the central lobe and that the modeling and soil data would suggest most significant continuing releases from soil.

The next slide discusses the conceptual model and notes these are rough approximations of source release timing; the source may have been active prior to 1960 as contaminants may have leached at concentrations that did not result in detectable groundwater concentrations.

Slide #22 discusses the source leading assessment.

The next slide is the first animation. Note that the work done on this animation is the 2004/2005 timeframe. This simulation was used during the investigation scoping. Mr. Goydas handed out a figure which shows the distribution of all detections of RDX and perchlorate. There is very low contamination of perchlorate and relatively small source areas. Do not expect to see any impact on groundwater and modeling will support that. RDX had slightly larger footprints and higher concentrations, especially in the I16/J16 area and a few other locations, for example at the melt/pour area.

Further animations were shown and discussed: Source and Burial Pit Forward Tracks; Initial Estimated RDX Mass Flux Loading in 2006 Contaminated Soil Footprint; RDX Soil Mass Flux Loading in Contaminated Soil Footprint; Perchlorate Soil Mass Flux Loading in Contaminated Soil Footprint; and Best-Matched Perchlorate Mass Flux Loading in Contaminated Soil Footprint.
Regarding the animation for Source and Burial Pit Forward Tracks (Perchlorate), Jane Dolan (EPA) asked about the source of the highest concentration in the J-2 North plume and if it tracks back to the disposal area or firing point. IAGWSP will forward a copy of the slide with an explanation of all features of the range and annotate the source areas.

The next slide discussed the J-2 East/Eastern Lobe Perchlorate Flux, perchlorate mass loading to the aquifer results; and the next slide discussed the J-2 East Flux, source simulations using leachate concentrations from SESOIL September 2006.

Soil source loading observations are: plume calibration simulations suggest little to no ongoing source loading (groundwater data support this finding); current contaminated soil mass is not sufficient to maintain the plume and remains within range boundary; soil contaminant footprint results in good match with observed plume (model suggests soil footprints are primary sources; however, cannot confirm that these were/are the only sources); and western sources (soil contamination and burial pits) may have contributed to eastern edge of the central lobe.

Next Steps – MEC Source Loading Hypothetical MEC Mass
MEC Loading – (Density/Mass Loading): Source area (soil and MEC) mass loading source term simulation to assess: comparability to observed plume and potential future impact on groundwater. Mass loading and potential impact on groundwater (number of munitions that will results in impacts on groundwater). This will be presented in the RI.

Tasks for RI – Assessment of leaching potential of existing soil contamination; predict mass density and loading from MEC items and evaluate potential impact on groundwater; conduct risk assessment to assess site conditions; identify potential data gaps based on available data, e.g. review of aerial photographs; assess aerial photographs from 1943, 1955, 1966, 1986, and 1991.

Next Steps: Proceed with data interpretation and contaminant leaching determination (soil and MEC) for Study 3 Area and roll into the RI. The RI will include full data of what has been done, what has been found, and a determination of restoration needs to be done.

J-2 Range Summary
This is a recap of what was done for each Study Area.

J-2 Area 1
Range Use Characteristics – periodic disposal over extended period, not linked to testing done at the range. Several burn/burial pits found. There was limited firing at the Berm 5 area. Chemical results indicate that current/recently removed soil contamination is relic source; contaminated soil footprint matches groundwater detections; data assessment indicates additional removal is required to complete the objectives of the RRA (this work is currently in progress); area adequately characterized for initiation of RI. However, an EM-61 survey will be conducted in the Disposal Area to QC previous UXO clearance, and an EM-61 survey will be conducted in the select areas not previously investigated (e.g. North of Study Area). This data will be evaluated in the RI.
The J-2 Area 1 figure was shown of post-excavation composite sample locations, existing monitoring wells; approximate subpolygon locations to be excavated, to be sampled, and no further action; and RRA excavation boundary with depths of 1.5, 2.5, and 3.5 ft bgs. There is also a summary table grouped by locations with description of field work, items found, approximate exc. vol (cy), pit bottom detections (ppb), and current actions.

J-2 Area 2
Range Use Characteristics – showed two primary sources – 1) a mix of munitions testing/firing and disposal of tested items, 2) munitions testing, as related to known targets. Chemical results indicate that current/recently removed soil contamination is a relic source. Some contamination remains in M19/20 area. Soil removal is in progress in this area under the BIP excavation program. Source footprints identified match existing groundwater data. Area adequately characterized for initiation of RI. However, an EM-61 survey will be conducted in portions to QC previous UXO clearance, and an additional EM-61 survey will be conducted adjacent to M19/20. Signal response/anomalies will be evaluated in the RI. The J-2 Area 2 Grids M19 and M20 BIP excavation figure was shown. This figure presents BIP excavations.

Numerous items were BIP'd and supplemental sampling was done. During surface clearing and excavation, numerous additional items were found (including 69 additional 30mm rockets) and were BIP'd. A cost analysis determined the best way to proceed is to excavate it all as hazardous waste. Post excavation sampling is anticipated to be similar to an RRA process. The depth of sampling will be one ft across the total area (total area is approximately 300 cy). IAGWSP is not proposing to do any sampling outside the excavated area. This will be documented in the RI. IAGWSP will provide EPA with more details on the post BIP excavation/sampling plan.

J-2 Area 3
Range Use Characteristics – primarily administrative functions, limited disposal of items linked to testing. Chemical results indicate that current/recently removed soil contamination may be relic source (at melt/pour are and burial cluster in I16 and J16). Source footprints identified match groundwater detections. Area adequately characterized for initiation of RI. However, and EM-61 survey will be conducted in portions to QC previous UXO clearance. The need to sample for perchlorate at the melt/pour area and the firing points will be evaluated in the RI to confirm there is complete coverage. The next slide is a figure of J-2 Range EM-61 survey locations. The next slide is a table of remaining samples at the J-2 Range, grouped by analyte, with in-situ samples of 0-1 ft and > 1 foot.

The next two graphics show the J-2 Range remaining RDX and perchlorate samples broken into surface and subsurface.

Next steps are to review the data to evaluate nature and extent of contamination, to support risk assessment and to estimate UXO density. Data are available to support general conceptual model of range activities and plume sources. Regulatory Agency comments considered in the RI evaluation are to QC EM-61 survey of previously UXO- cleared areas scheduled to validate they were cleared; reviewed the EM-61 survey of select uninvestigated areas scheduled. IAGWSP does not believe that additional soil sampling (requested by EPA) is required prior to initiating the RI. When we assess the sample results if we do feel additional characterization or delineation are required, we will propose that. At this point most soil sampling has been proposed other than what comes out from the MSP polygons or the BIP excavations.

J-1 EM-61 Survey and Geophysical Investigations

Three slides were introduced. Site Map of J-1 Range Geophysical Survey QC (identifies portion previously cleared); J-1 Range Geophysical Survey Results and Recommended MEC Density Cell; and J-1 Range/CIA One-Acre Grids and Proposed Cell (identifies grids ranked medium and high density by the CIA team).

EPA has concerns of not having sufficient groundwater well coverage in J-1 and J-2 areas, and in J-1 why the target pit investigation was not completed. EPA and IAGWSP discussed location of wells, data analyses, source areas, habitat issues, objectives, and efficient methods to use to identify source areas, etc. It was decided to regroup on this issue; to review all the data available to determine if there is coverage.

J-1 RRA

Dave Hill (IAGWSP) is proposing to install an extraction well on the fence line of the south plume and begin pumping as soon as the mobile treatment units currently at Demo-1 become available. Mr. Hill requested using a Project Note process instead of the Workplan Process. The Regulatory Agencies agreed to review a Project Note.

Former K Range Update

Direct Push all came back ND. At this point, a MEC density analysis is necessary and appropriate. IAGWSP reviewed the proposal given to the Regulatory Agencies on the L Range RCL for a basis to go from. Dave Hill noted that groundwater contamination has still not been detected at Former K Range; and he will forward a copy of the DP data to EPA and MassDEP. It was agreed to reconvene at the 10/26 Tech meeting to map out the next steps at this site. EPA Issue: Screening from COPC to COCs. Part of that had to do with leaching numbers. After Bob Lim (EPA) receives the groundwater data, he will review to determine if there are any issues that need further discussion.

The following are the notes from the October 12, 2006 Technical Team meeting of the Impact Area Groundwater Study Program office at Camp Edwards

Southeast Ranges

At the request of EPA, the way forward for UXO will be on the agenda for a senior level meeting to be held in November. In preparation for this meeting, Mr. Pinaud (DEP) suggests preparing background information including a paper survey of the UXO density of each of the ranges, a list

of options for dealing with the issue, a list of priorities, and suggestions on how to deal with the UXO issue to present to the senior staff. If EPA has a specific concern about a controlled burn in an area where there are UXO issues, that needs to be on the table when the plan for dealing with UXO is discussed.

L Range Soil Characterization Report (dated 28 April 2006) Comment Review
IAGWSP Responses for General Comments 3 and 6 are fine.

General Comment 1: Comment noted. IAGWSP is working toward a procedure for assessment of MEC density and calculation of containment flux from UXO to groundwater.

General Comment 2: Language provided by Jane Dolan (EPA) in the MOR will be inserted.

General Comment 4: When the soil report is revised, provide specific cross references to the groundwater report where appropriate.

General Comment 5: The areas outside the perimeter of the L Range fence will be addressed in another forum, perhaps the WASA.

General Comment 7: Include discussions concerning the SESOIL/Summers Modeling as part of the HERA Work Plan. Ms. Dolan will provide the language to IAGWSP.

IAGWSP Responses for Specific Comments 1 through 4, 6 and 7, 9, 11 and 12, 14 through 16, 18, 21 through 29, 31 through 42 are fine.

Specific Comment 5: EPA requests IAGWSP to review and include reference to use of rifle and shotgun use in the ASR.

Specific Comment 8: The existence of the dud pit will be evaluated based on visual survey during MEC density clearance/assessment at the L Range.

Specific Comment 10: EPA requests additional statement that IAGWSP will evaluate airmag pictures outside the current L Range fence in another venue.

Specific Comment 13: EPA requested adding feet away from targets in BD, M, I.

Specific Comment 17: EPA states some organic compounds have been omitted; IAGWSP will review.

Specific Comment 19: EPA requests listing constituents of items used at that range. IAGWSP agreed to include.

Specific Comment 20: EPA and IAGWSP agreed to add cross reference to the groundwater report.

Specific Comment 30: EPA requests adding the text to the report.

Specific Comment 40: Fifth line of IAGWSP Response: IAGWSP will change “with EPA’s concurrence” to a more distinctive reference. In the sixth line remove the word “continuing” and add “soil”.

Well location for J-1 Range 2,000 Meter Berm Area: Ms. Dolan states the location is too close to the berm, and there is a habitat issue in the area, and asked what the basis for this decision was. Dave Hill (IAGWSP) noted that the well was located near the berm because the DQO is to determine if the 2000 meter berm is a source of contamination. The well will be installed using a screened auger and an SOP from the IRP QAPP will be followed. EPA and IAGWSP agreed with the IAGWSP proposed location.

Potential Pit Targets: IAGWSP is investigating 20 additional potential pit targets, at the J-1 Range. The ROA has been approved. Two targets are complete and munitions were not found. The weekly updates for the additional 20 anomalies will be done per the established practice.

Access to Windsong Road: Has not yet been recorded in land court; will try contacting the Town for update.

Status of CIA PSI Fieldwork – Scott Greene

Scott Greene (USACE) presented the status of the CIA PSI Fieldwork. The general purpose of the fieldwork: validate UXO density model; better define extent of significant source areas (>2 ug/l); confirm and/or delineate detections in previous soil sampling; and conduct sampling methodology comparison and particulate study (grinding vs. non-grinding).

Two test plots are complete (L-2 and M-2) and four test plots are in progress (L-1, M-1, H-1, and H-2). Each test plot is approximately 10,000 sq ft. Three new test plots have been proposed (H-3, M-3, and L-3). Desiree Moyer (EPA) agreed with the locations; EPA's official agreement of locations is needed. EPA requested the figure be revised to locate all the grids and their density.

Of the 22 drivepoints originally proposed, 16 have been installed, four encountered refusal and were unable to be installed, and two contingent locations not installed. Regarding groundwater detections: RDX was detected in three of 16 samples (none above 2 ppb), perchlorate detected in four of 16 samples (below 1 ug/l) and all were non-detect for TNT. Regarding soil samples, two samples were collected at each attempted location (40 samples), 30 point composites (25X25 grid, upgradient of drivepoints): all were non-detect for RDX, perchlorate was detected in four of 40 samples (low concentration below .31 ug/kg), and TNT detected in one of 40 samples (550 ug/kg).

Six additional drivepoints were installed to further delineate 2 ppb water table contour. Of groundwater detects: RDX was detected in five of six samples (.79-3.4 ppb), perchlorate detected in one of six samples (.68 ppb), and TNT detected in one of six samples (1.2 ppb). Soil samples will be completed this month.

For HUTA II/SCAR soil sampling, 21 soil samples were collected and all were non-detect for RDX, perchlorate, and TNT.

Target 34 (south of Tank Alley) soil sampling results: 30 point composite samples in five 15X15 grids around Target 34. Explosives were detected in one grid only. A comparison of ground and un-ground was done. Un-ground results: RDX – 12000 ug/kg, 4900 ug/kg; ground results: RDX – 5200 ug/kg, 5300 ug/kg. The average RPD for all compounds detected in the ground samples is 3.45%.

CRREL conducted a particulate study on Target 34 soils (100 point composites were collected from all five grids) and could not identify any explosive particulates. IAGWSP shipped remaining sample soil from Grid 4 (explosives detections) to CRREL and are waiting for the results of the study.

The PSI field schedule: UXO Test Plots: the original six test plots will be complete by 11/17/2006 and the additional three test plots complete by 2/28/2007. Drivepoint soil sampling: 12 additional soil samples will be complete by 10/30/2006. The Particulate Study will be complete by 11/30/2006.

IART Meeting for October 2006

The EPA convened a meeting of the Impact Area Groundwater Review Team on October 24, 2006. The agenda included the J-1 and J-2 Range soil Remedial Investigation update (including the Groundwater Monitoring Plan), the Western Boundary Remedial Investigation Report, and the Massachusetts National Guard Small Arms Range Training Improvement Process status update.

3. SUMMARY OF DATA RECEIVED

Validated Data

Table 5 (sorted by analyte) summarizes the detections, since 1997, that equaled or exceeded an EPA Maximum Contaminant Level (MCL), MassDEP MCL (MMCL) or Health Advisory (HA) for drinking water. Table 5 is updated on a monthly basis; discussions in the text are updated on the same schedule as Figures 1 through 8, which are discussed later in this section.

Table 6 summarizes first-time validated detections of explosives and perchlorate below the MCL/MMCL/HA for drinking water received from September 29, 2006 through October 27, 2006. First-time validated detections of VOCs, SVOCs, herbicides and pesticides are included and discussed quarterly in the March, June, September, and December Monthly Progress Reports. Metals, chloroform, and bis (2-ethylhexyl) phthalate (BEHP) are excluded from Table 6 for the following reasons: metals are a natural component of groundwater, particularly at levels below MCLs or HAs; detections of chloroform are pervasive throughout Cape Cod and are not likely the result of military training activities; and BEHP is believed to be largely an artifact of the investigation methods and introduced to the samples during collection or analysis.

Figures 1 through 8 depict the cumulative results of groundwater analyses for the period from the start of the Impact Area Groundwater Study (July 1997) to the present. Each figure depicts results for a different analyte class:

- Figure 1 shows the results of explosive analyses by EPA Method 8330. This figure is updated and included each month.
- Figure 2 shows the results of inorganic analyses (collectively referred to as “metals”, though some analytes are not true metals) by methods E200.8, 300.0, 350.2M, 353M, 365.2, CYAN, IM40MB, IM40MBM, and IM40HG. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 3 shows the results of Volatile Organic Compound (VOC) analyses by methods OC21V, OC21VM, 504, 8021W, and SW8260 exclusive of chloroform detections. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.

- Figure 4 shows the chloroform results using the Volatile Organic Compound (VOC) analyses by method OC21V and OC21VM. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 5 shows the results of Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270, exclusive of detections of BEHP. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 6 shows the BEHP results using the Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 7 shows the results of Pesticide (method OL21P) and Herbicide (method 8151) analyses. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 8 shows the results of Perchlorate analysis by method E314.0. This figure is updated and included each month.

The concentrations from these analyses are depicted in Figures 1 through 7 compared to Maximum Contaminant Levels (MCLs) or Health Advisories (HAs) published by EPA for drinking water. For Figures 1 through 7, a red circle is used to depict a well where the concentration of one or more analytes was greater than or equal to the lowest MCL or HA for the analyte(s). A yellow circle is used to depict a well where the concentration of all analytes was less than the lowest MCL or HA. A green circle is used to depict a well where the given analytes were not detected in groundwater samples. For Figure 8, a red circle is used to depict a well where the concentration of perchlorate was greater than or equal to 24 ppb (EPA's Drinking Water Equivalent Level (DWEL) derived from the 2005 National Academy of Science (NAS) report). An orange circle is used to depict a well where the concentration of perchlorate is above 2 ppb (the Massachusetts MCL (MMCL)) and below 24 ppb. A yellow circle is used to depict a well where the concentration of perchlorate was less than 2 ppb. A green circle is used to depict a well where perchlorate was not detected in groundwater samples. For all figures, an open circle is used to depict a proposed well where the analytes in question for example, Explosives in Figure 1, have not yet been quantified. A black circle represents a well that has been sampled for analytes, but validated groundwater data is not yet available.

There are multiple labels listed for some wells in Figures 1 through 8, which indicate multiple well screens at different depths throughout the aquifer. The aquifer is approximately 200 to 300 feet thick in the study area. Well screens are positioned throughout this thickness based on various factors, including the results of groundwater profile samples, the geology, and projected locations of contaminants estimated by groundwater modeling. The screen labels are colored to indicate which of the depths had the chemical detected above drinking water standards. Generally, groundwater entering the top of the aquifer will move deeper into the aquifer as it moves radially outward from the top of the water table mound. Light blue dashed lines in Figures 1 through 8 depict water table contours. Groundwater generally moves perpendicular to these contours, starting at the center of the 70-foot contour (the top of the mound) and moving radially outward. The rate of vertical groundwater flow deeper into the aquifer slows as groundwater moves away from the mound.

The results presented in Figures 1 through 8 are cumulative, which provides a historical perspective on the data rather than a depiction of current conditions. Any detection at a well that equals or exceeds the MCL/DWEL/HA results in the well having a red symbol, regardless of later detections at lower concentrations, or later non-detects. The difference between historical and current conditions varies according to the type of analytes. There are little or no differences

between historical and current exceedances of drinking water criteria for Explosives, Perchlorate, VOCs, Pesticides, and Herbicides; the minor differences are mentioned in the following paragraphs. There are significant differences between historical and current exceedances of drinking water criteria for Metals and SVOCs, as described further below.

Figure 1: Explosives in Groundwater Compared to MCLs/HAs

For data validated in October 2006, no wells had a first-time validated detections of explosives above or below the MCL/HA.

Exceedances of drinking water criteria for explosive compounds are indicated in six general areas:

- Demo Area 1 (wells 19, 31, 34, 73, 76, 77, 114, 129, 165, 210, and 211);
- Demo Area 2 (wells 16, 160, 259, 262, and 404);
- The Impact Area and CS-19 (wells 58MW0001, 58MW0002, 58MW0009E, 58MW0011D, 58MW0016B, 58MW0016C, 58MW0018B; and wells 1, 2, 23, 25, 37, 38, 40, 43, 85, 86, 87, 88, 89, 90, 91, 93, 95, 98, 99, 100, 101, 105, 107, 111, 112, 113, 176, 178, 184, 201, 203, 204, 206, 207, 209, 223, 235, OW-1, OW-2, and OW-6);
- J Ranges and southeast of the J Ranges (wells 45, 58, 130, 132, 147, 153, 163, 164, 166, 171, 191, 193, 196, 198, 215, 218, 227, 232, 234, 247, 265, 289, 303, 306, 324, 326, 343, 346, 360, 368, 398, and wells 90MW0022, 90MW0041, 90MW0054 and 90WT0013);
- Landfill Area 1 (wells 27MW0018A, 27MW0020A, and 27MW0020B); and
- Northwest Corner of Base Boundary (well 323).

Exceedances of drinking water criteria were measured for TNT at Demo Area 1 (wells 19S, 31S, 31M, and 31D) and Southeast of the Ranges (196S). Exceedances of the HA for RDX were noted at all of the locations listed above except at MW-45, MW-196, and the LF-1 wells. Exceedances of drinking water criteria were measured for 2,6-dinitrotoluene (2,6-DNT) at MW-45S. Exceedances of drinking water criteria were measured for 1,3-dinitrobenzene at LF-1 wells 27MW0018A, 27MW0020A and 27MW0020B.

Demo Area 1 has a single well-defined source area and extent of contamination. The estimated extent of RDX exceeding the HA at Demo Area 1 based on the most recent groundwater measurements is indicated by a magenta concentration contour line on Figure 1 and Inset A.

Demo Area 2 has five groundwater exceedances of the RDX HA at MW-16S, MW-160S, MW-259, MW-262M1, and MW-404M2. The extent of the contamination is currently under investigation.

The Impact Area has a plume defined by RDX concentrations above the HA of 2 ppb. The plume originates primarily along Turpentine Road and extends downgradient to the west-northwest. Another source of RDX in the Impact Area is CS-19. Portions of CS-19 are currently under investigation by the Air Force Center for Environmental Excellence (AFCEE) under the Superfund program. The extent of RDX has largely been defined in the Impact Area and the investigation phase of the project is nearing completion.

The J Ranges and downgradient areas have five groundwater plumes defined by concentrations of RDX above the HA of 2 ppb. The five plumes originate at the J-1 Range Interberm Area (northern plume in the vicinity of MW-58 and MW-265), the J-2 Range North plume (northern plume extending from MW-130), the J-2 Range East plume (eastern plume including MW-215),

the J-3 Range Demolition Area (southern plume extending from MW-163 south to Snake Pond) and the L Range (in an area defined by MW-147 and MW-153 at Greenway Road). In addition, RDX detections at MW-398M2 suggest a possible plume at the south end of the J-1 Range. All the J ranges and the L Range are currently under investigation and the plumes will be updated and refined as new validated data is received.

The Northwest Corner of the base boundary has one validated detection of RDX in groundwater above the HA of 2 ppb at MW-323M2. The M1 screen in this location has a validated detection of RDX in groundwater below 2 ppb.

Figure 2: Metals in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for metals are scattered throughout the study area. Where two or more rounds of sampling data are available, the exceedances generally have not been replicated in consecutive sampling rounds. The exceedances have been measured for antimony, arsenic, cadmium, chromium, lead, molybdenum, sodium, thallium and zinc. Exceedances of the arsenic drinking water criteria were repeated at three (wells 58MW0010A, MW-7M1 and MW-45S) of the six locations with arsenic exceedances. At the remaining three locations (wells MW-3D, MW-52M2 and MW-152M1), arsenic exceedances were not repeated in subsequent results. Cadmium (well MW-52M3) and chromium (well MW-7M1) were each detected above drinking water criteria in a single sampling round in August-September 1999. Exceedances of the drinking water criteria for lead were repeated at two of four locations (wells ASP and MW-45S). At the remaining two locations (wells MW-2S and MW-7M1) lead exceedances were not repeated in subsequent results. Exceedances of the drinking water criteria for molybdenum were repeated at two of eight locations (wells MW-53M1 and MW-54S) with molybdenum exceedances. All of the molybdenum exceedances were observed in year 1998 and 1999 results. Exceedances of the drinking water criteria for sodium were repeated at 12 of the 21 locations with sodium exceedances (wells MW-2S, MW-21S, MW-46S, MW-57M3, MW-57M2, MW-57M1, MW-144S, MW-145S, MW-148S, MW-187D, ASP and SDW261160). Seven wells (MW-21S, MW-57M1, MW-57M3, MW-187D, BHW215083B, BHW215083D and ASP) had sodium exceedances in year 2004, 2005, and/or 2006 results. Zinc exceeded the HA in seven wells, all of which are constructed of galvanized (zinc-coated) steel.

There have been few exceedances of drinking water limits for antimony and thallium since the introduction of the ICP/GFAA and ICP/MS methods, discussed in the next paragraph. None of the 13 locations with antimony exceedances had repeated exceedances and only one exceedance (well MW-38M2) was measured since January 2003. Eleven of the 72 locations with thallium exceedances had repeated exceedances in subsequent sampling rounds (wells MW-7M1, MW-19S, MW-45S, MW-47M2, MW-47M3, MW-52S, MW-52D, MW-54S, MW-54M1, MW-58S and MW-94M2). There have been no exceedances of thallium since January 2003.

Groundwater samples sent for metals analysis are analyzed for most metals by Inductively Coupled Plasma (ICP) in accordance with U.S. EPA Contract Laboratory Program Statement of Work ILM04.0. In May of 2001, the IAGWSP began analyzing for antimony and thallium using the GFAA (graphite furnace atomic adsorption) method in accordance with EPA Drinking Water Methods 204.2 (antimony) and 279.2 (thallium) in order to achieve lower detection limits for these metals. Both the ILM04.0 and GFAA methods are subject to false positive results at trace levels due to interferences. As a result, the IAGWSP changed to a new method to achieve lower detection limits for antimony and thallium in January of 2003. Groundwater samples are now analyzed for antimony and thallium by Inductively Coupled Plasma/Mass Spectroscopy (ICP/MS) in accordance with the EPA Method 6020. The ICP/MS Method 6020 has greater

sensitivity and the added feature of selectivity for antimony and thallium. These additional methods achieve lower detection limits for these two metals and reduce the number of false positive results.

The distribution and lack of repeatability of the metals exceedances is not consistent with a contaminant source, nor do the detections appear to be correlated with the presence of explosives or other organic compounds. The IAGWSP evaluated inorganic background concentrations using the groundwater quality database of 1999, and submitted a draft report describing background groundwater quality in December 1999.

Figure 3: VOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for VOCs are indicated in six general areas: Northeast Corner (well LRMW003), Impact Area boundary (MW-28S), CS-10 (wells 03MW0007A, 03MW0014A, and 03MW0020), LF-1 (well 27MW0017B), FS-12 (wells MW-45S, 90MW0003, and ECMWSNP02D), and in the J-1 Range (well MW-187D). CS-10, LF-1, and FS-12 are sites located near the southern extent of the Training Ranges that are currently under investigation by AFCEE under the Superfund program. Exceedances of drinking water criteria were measured for tetrachloroethylene (PCE) at CS-10, for vinyl chloride at LF-1, and for methylene chloride, toluene, 1,2-dichloroethane, and ethylene dibromide (EDB) at FS-12. These compounds are believed to be associated with the sites under investigation by AFCEE. Detections of benzene, tert-butyl methyl ether, and chloromethane at J-1 Range well MW-187D, chloromethane at Northeast Corner well LRMW003, and 1,2-dibromo-3-chloropropane at Impact Area boundary well MW-28S are currently under investigation.

Figure 4: Chloroform in Groundwater Compared to MCLs

Chloroform has been widely detected in groundwater across the Upper Cape as stated in a joint press release from USEPA, MassDEP, IRP, and the Joint Programs Office. The Cape Cod Commission (2001) in their review of public water supply wells for 1999 found greater than 75% contained chloroform with an average concentration of 4.7 ug/L. The IRP has concluded chloroform is not the result of Air Force activities. A detailed discussion of the presence of chloroform is provided in the Final Central Impact Area Groundwater Report (06/01). To date, the source of the chloroform in the Upper Cape groundwater has not been identified.

Figure 5: SVOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for SVOCs are scattered throughout the study area. All exceedances of drinking water criteria for SVOCs were measured for bis (2-ethylhexyl) phthalate (BEHP), with the exception of two wells. MW-264M1 (J-3 Range) had a detection of benzo(a)pyrene at concentrations of more than twice the HA and MW-241M1 (L Range) had detections of naphthalene above the HA of 100 ppb. Detections of BEHP are presented separately in Figure 6 and discussed in the next paragraph.

Figure 6: BEHP in Groundwater Compared to MCLs

Exceedances of drinking water criteria for bis (2-ethylhexyl) phthalate (BEHP) are scattered throughout the study area. BEHP is believed to be largely an artifact of the investigation methods, introduced to the samples during collection or analysis. However, the potential that some of the detections of BEHP are the result of activities conducted at MMR has not been ruled out.

A detailed discussion of the presence of BEHP is provided in the Draft Completion of Work Report (7/98) and subsequent responses to comments. The theory that BEHP mostly occurs as an artifact, and is not really present in the aquifer, is supported by the results of subsequent sampling rounds that show much lower levels of the chemical after additional precautions were taken to prevent cross-contamination during sample collection and analysis. Only four locations (out of 90) showed BEHP exceedances in consecutive sampling rounds: 28MW0106 (located near SD-5, a site under investigation by AFCEE), 58MW0006E (located at CS-19), and 90WT0013 (located at FS-12), and MW-146M1 (located at L Range). Subsequent sampling rounds at all these locations have had results below the MCL. Eleven wells (27MW0705, 27MW2061, C2-B, C6-C, C7-B, MW-47M2, MW-164M1, MW-168M1, MW-188M1, MW-196M1, and MW-198M1) had BEHP exceedances in the year 2002 and 2003 results. There have been no exceedances of BEHP in 2004 and one exceedance of BEHP, at MW-356M1 (J-3 Range), in 2005.

Figure 7: Herbicides and Pesticides in Groundwater Compared to MCLs/HAs

There has been one exceedance of drinking water criteria for pesticides, at well PPAWSMW-1. A contractor to the United States Air Force installed this monitoring well at the PAVE PAWS radar station in accordance with the Massachusetts Contingency Plan (MCP), in order to evaluate contamination from a fuel spill. The exceedance was for the pesticide dieldrin in a sample collected in June 1999. This well was sampled again in November 1999. The results of the November sample indicate no detectable pesticides although hydrocarbon interference was noted. It appears from the November sample that pesticides identified in the June sample were false positives. However, the June sample results cannot be changed when following the EPA functional guidelines for data validation. The text of the validation report for the June sample has been revised to include an explanation of the hydrocarbon interference and the potential for false positives.

There has been one exceedance of drinking water criteria for herbicides, at well MW-41M1 (Impact Area). This response well was installed downgradient of the Impact Area. The exceedance was for the herbicide pentachlorophenol in a sample collected in May 2000. There were no detections above the MCL of this compound in the three previous sampling rounds in 1999, nor in the subsequent sampling rounds in 2000, 2001, 2002, and 2003.

Figure 8: Perchlorate in Groundwater Compared to a 2 ppb Concentration

For data validated in October 2006, no wells had first-time validated detections of perchlorate above or below the MMCL of 2 ppb.

Sampling and analysis of groundwater for perchlorate was initiated at the end of the year 2000 as part of the IAGWSP. Cumulative exceedances of the 2 ppb concentration of perchlorate are indicated in seven general areas:

- Demo Area 1 (wells 19, 31, 32, 33, 34, 35, 36, 73, 75, 76, 77, 78, 114, 129, 139, 162, 165, 172, 210, 211, 225, 258 and 341);
- Impact Area and CS-19 (wells 58MW0009C, 58MW0015; and wells 38, 89, 91, 93, 101, and OW-1);

- J Ranges and southeast of the J Ranges (wells 93, 125, 127, 128, 130, 132, 142, 143, 158, 163, 166, 193, 197, 198, 215, 232, 234, 237, 243, 247, 250, 263, 265, 286, 289, 293, 295, 300, 302, 303, 305, 307, 310, 313, 319, 321, 324, 326, 329, 339, 343, 346, 348, 366, 368, 370, and wells 90PZ0211, 90MW0022 and 90MW0054, 90WT0013, and RS003P);
- Landfill Area 1 (27MW0031B);
- CS-18 (well 16MW0001);
- Northwest Corner of Base Boundary (wells 4036009DC, 66, 270, 277, 278, 279, 283, 284, 287, 297, 301, 309, 323, and RSN0W3); and
- Western Boundary (wells 80, 233, and 267).

Demo Area 1 has a single well-defined source area and extent of contamination. The downgradient extent of the perchlorate plume has been determined with the installation of monitoring wells along the power line right-of-way east of Fredrickson Road.

The Impact Area has eight locations with exceedances of the 2 ppb concentration of perchlorate. The perchlorate plume extends from near the center of the Impact Area to the northwest, in the vicinity of Burgoyne Road.

Plumes have been identified in four areas in the J Ranges. The J-1 Interberm perchlorate plume has several perchlorate detections in downgradient locations MW-265, MW-286, MW-303, MW-326, MW-346, and MW-370. The J-3 Range Demolition perchlorate plume has detections in several wells immediately downgradient of the source area, which is centered at MW-198, and further downgradient centered near location 90MW0054. The J-2 Range North perchlorate plume has detections at source area locations MW-130 and MW-263, and downgradient locations MW-289, MW-293, MW-300, MW-302, MW-305, and MW-313. The J-2 East perchlorate plumes are in the process of delineation and include detections at MW-307, MW-310 and MW-368. There is a single perchlorate detection (well 90WT0013) at the L Range which exceeds the 2 ppb concentration.

The Northwest Corner has a perchlorate plume extending from Canal View Road at the base boundary to the Cape Cod Canal. This area is under investigation and the plume will be updated and refined as new data is received.

The LF-1 and CS-18 areas are under investigation by AFCEE in the Superfund Program.

The Western Boundary has three locations (wells 80, 233, and 267) which exceed the 2 ppb perchlorate MMCL.

Rush (Non-Validated) Data

Rush data are summarized in Table 7. These data are for analyses that are performed on a fast turnaround time, typically 1 to 10 days. Explosive analyses for monitoring wells, and explosive and VOC analyses for profile samples, are typically conducted in this timeframe. Other types of analyses may be rushed depending on the proposed use of the data. The rush data have not yet been validated, but are provided as an indication of the most recent preliminary results. Table 7 summarizes only detects, and does not show samples with non-detects.

In October, there was either no rush data received or it was non-detect for all analytes, therefore Table 7 is not included in this report.

4. DELIVERABLES SUBMITTED

Deliverables submitted during the reporting period include the following:

Monthly Progress Report # 114 for September 2006	10/09/2006
Draft BIP Summary Report – January 2006 to June 2006 UXO Detonations	10/11/2006
Final Ammunition Supply Point Rapid Response Action Work Plan	10/16/2006

5. SCHEDULED ACTIONS

Figure 9 provides a Gantt chart updated as of September 10, 2006, to reflect progress and proposed work. The following documents are scheduled to be submitted in November and early December:

- Demo 1 Soil Final Rapid Response Action Completion of Work Report
- J-2 Range Soil Final Rapid Response Action Completion of Work Report
- J-3 Range Soil Final Remedial Investigation Report
- J-3 Range Groundwater Draft Remedial Investigation/Feasibility Study Report
- L Range Groundwater Final Risk Assessment Report
- Central Impact Area Targets 23/42 Final Rapid Response Action Completion of Work Report
- Central Impact Area Final Interim Groundwater Monitoring Plan
- Central Impact Area Soil and Groundwater Draft Feasibility Study Screening Report
- Western Boundary Final Remedial Investigation Report
- Northwest Corner Final Interim Groundwater Monitoring Plan
- Demo 2 Groundwater Draft Remedial Investigation/Feasibility Study Report
- Gun & Mortar Final Interim Groundwater Monitoring Plan
- Former A Range Draft Remedial Investigation Report
- Former K Range Final Remedial Investigation Report
- Former K Range Final Interim Groundwater Monitoring Plan
- Phase IIb Final Remedial Investigation Report
- Ammunition Supply Point Final Rapid Response Action Work Plan
- Wide Area Source Assessment Final Generic Work Plan

The following documents are being prepared or revised during October and early November:

- J-1 Range Soil Draft Remedial Investigation Report
- J-1 Range North Groundwater Draft Remedial Investigation/Feasibility Study Report
- J-1 Range Southeast Groundwater Draft Rapid Response Action Report
- J-2 Range Soil Draft Remedial Investigation Report
- J-2 Range Groundwater Draft Remedial Investigation/Feasibility Study Report
- L Range Soil Final Remedial Investigation Report
- L Range Groundwater Draft Feasibility Study Report
- Central Impact Area Soil Draft Remedial Investigation Report
- Northwest Corner Draft Remedial Investigation/Feasibility Study Report
- Gun & Mortar Groundwater and Soil Final Remedial Investigation Work Plan
- Ammunition Supply Point Draft Rapid Response Action Completion of Work Report
