

**MONTHLY PROGRESS REPORT #114
FOR SEPTEMBER 2006**

EPA REGION I ADMINISTRATIVE ORDERS SDWA 1-97-1019 and 1-2000-0014

**MASSACHUSETTS MILITARY RESERVATION
TRAINING RANGE AND IMPACT AREA**

The following summary of progress is for the period from September 1 to September 30, 2006. Scheduled actions are for the six-week period ending November 10, 2006.

1. SUMMARY OF REMEDIATION ACTIONS

The following is a description of remediation actions underway at Camp Edwards as of September 29, 2006. Remediation actions may include Rapid Response Actions (RRA). An RRA is an interim action that may be conducted prior to risk assessments or remedial investigations to address a known, ongoing threat of contamination to groundwater and/or soil.

Demo Area 1 Groundwater RRA

The Demo Area 1 Groundwater RRA consists of the removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. Extraction, treatment, and recharge (ETR) systems at Frank Perkins Road and Pew Road include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Pew Road ETR continues operation at a flow rate of 100 gallons per minute (gpm). As of September 29, 2006, approximately 103 million gallons of water have been treated and re-injected at the Pew Road ETR System.

The Frank Perkins Road ETR continues operation at an increased flow rate of 330 gpm, following completion of well vault piping at extraction well EW 503. As of September 29, 2006, approximately 221 million gallons of water had been treated and re-injected at the Frank Perkins Road ETR System.

Demo Area 1 Comprehensive Groundwater Remedial Action

The final remedy for Demo Area 1 groundwater will increase total flow to a rate of 906 gpm from five extraction wells, three of which will be new construction, with recharge of treated water via four injection wells. The Pew Road ETR system will remain in place, and the Frank Perkins Road temporary ETR System will be replaced by a permanent treatment facility.

During the month of September, the following work was performed: Complete installation of piping and electrical components in well vaults. Completed site clearing and grubbing activities. Commenced excavation and placement of rebar for the building foundation. Commenced construction of rear access road.

J-2 Range Groundwater RRA

The J-2 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and infiltration basins to return treated water to the aquifer.

During the month of September, the following work was performed: Completed miscellaneous electrical work in the treatment building. Continued construction punch list activities. Completed ETR start-up in accordance with the Performance Monitoring Evaluation (PME) Plan. Commenced full design treatment flow of 375 gpm on September 6, 2006.

J-3 Range Groundwater RRA

The J-3 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater and use of the existing Fuel Spill-12 (FS-12) infiltration gallery to return treated water to the aquifer.

During the month of September, the following work was performed: Continued construction punch list activities. Completed ETR start-up in accordance with the System Performance and Ecological Impact Monitoring (SPIEM) Plan. Commenced full design treatment flow of 175 gpm on September 1, 2006.

2. SUMMARY OF ACTIONS TAKEN

Drilling progress for the month of September is summarized in Table 1.

Table 1. Drilling progress as of September 30, 2006				
Boring Number	Purpose of Boring/Well	Total Depth (ft bgs)	Depth to Water Table (ft bgs)	Completed Well Screens (ft bgs)
DP-452	Impact Area (CIADP-26)	127	120	
DP-453	Impact Area (CIADP-27)	129	122	
DP-463	Ammunition Supply Point (ASPD-1)	100	95	
DP-464	Ammunition Supply Point (ASPD-2)	102	98	

ft bgs = ft below ground surface

Samples collected during the reporting period are summarized in Table 2. Completed drilling at drive point locations DP-452 (CIADP-26), DP-453 (CIADP-27), DP-463 (ASPD-1), and DP-464 (ASPD-2).

Groundwater profile samples were collected from DP-452, DP-453, DP-463, and DP-464. Groundwater samples were collected from recently installed wells at J-1 Range, J-2 Range, and Demo Area 2. Groundwater samples were collected in accordance with the Interim Groundwater Monitoring Plans (GMPs) for 2006 at Demo Area 2, J-2 North Range, J-2 East Range, and Northwest Corner. Post Blown in Place (BIP) excavation confirmation soil samples were collected at the Gravity Range, J-1 Range, J-2 Range, J-3 Range, and Central Impact Area (CIA). Supplemental soil samples were collected at various Blown in Place (BIP) locations at the J-1 Range and J-2 Range in accordance with the BIP Sampling and Analysis Plan. Soil samples were collected at the former munitions survey program (MSP) sub-polygons in the J-2 Range. Surface water samples were collected near a public beach, a private beach, and near the spit at Snake Pond.

The following bullets summarize the BIP items for the month of September. The pre- and post-BIP sample collection dates are shown:

- Impact Area:
September 12/13, 2006: Two (2) 60 mm mortars at Test Plot M-1
September 12/13, 2006: Five (5) 81 mm mortars at Test Plot M-1
September 12/13, 2006: One (1) 81 mm mortar at Test Plot L-1
September 12/13, 2006: One (1) 37 mm projectile at Test Plot L-1
September 12/13, 2006: One (1) 60 mm mortar at Test Plot L-1
September 20/21, 2006: Three (3) 81 mm mortars at Test Plot H-2
September 20/28, 2006: Two (2) 81 mm mortars at Test Plot H-1
September 21/21, 2006: One (1) 155 mm projectile at Turpentine Road, Grid TRU-02
September 21/21, 2006: One (1) 81 mm mortar at Turpentine Road, Grid TRU-09
September 27/28, 2006: One (1) 60 mm mortar at Test Plot H-1

Pre- and post-BIP samples, summarized in Table 2, were collected in accordance with the sampling protocol.

Anomaly investigation as part of the Impact Area Post Screening Investigation (PSI) continued. Tables 3A, 3B, 3C, 3D, 3E, and 3F show the grid summary for Test Plots H-1, H-2, L-1, L-2, M-1, and M-2, respectively.

The following are the notes from the September 14, 2006 Technical Team meeting of the Impact Area Groundwater Study Program office at Camp Edwards

CIA Feasibility Study Screening Report (FSSR) Alternatives 3 and 4 is a continuing series of presentations on the Central Impact Area (CIA) Feasibility Study Screening Report (FSSR). Today's presentation is the Interim Results for Alternatives 3 and 4.

Bill Gallagher (IAGWSP) gave an overview of the presentation. The discussions included Alternatives 3 and 4 objectives and results, and the next steps.

Alternatives 3 and 4 integrate all three remediation processes: active pumping, containment, and natural attenuation.

Alternative 3 design considerations include soil remediation in 2010 (24 acre option); containment of persisting source areas; collapse areas of higher concentration; natural attenuation of dilute portions of the plume outside the areas of higher concentrations; running containment system for 30 years to compare with the other systems; explore multiple well configurations for higher concentrations (Alternative 3.1; 3.2a; 3.2b). The Alternative 3 Conceptual Design slide was shown.

Alternative 4 design considerations include soil remediation in 2010 (24 acre option); containment of the RDX plume (>0.6 ppb) at Spruce Swamp Road; containment system running for 30 years; natural attenuation of the plume downgradient of Spruce Swamp Road to reduce the concentration of RDX to <0.6 ppb in 60 years. The Alternative 4 Conceptual Design slide shows locations of the proposed extraction wells, proposed injection wells, and pumping station. The proposed system design of containment wells (2010 to 2040) requires 14 extraction wells, seven reinjection wells, and one treatment plant all pumping at a rate of 1,550 gpm (or 2.2 mgd). At some point when the plume shrinks, some of these wells can be shut down and would require seven extraction wells, four reinjection wells, and one treatment plant at a pumping rate of 775 gpm (1.1 mgd) to contain the plume after 2040. The next slide shows the plume after ten years, 30 years, and 60 years.

The next two slides were graphs showing Alternative 4 Volume of RDX Plume > 0.6 ppb and > 2.0 ppb. EPA and MassDEP found these graphs to be very confusing and requested the data be presented using the format AFCEE used on the Ashumet Pond presentation that compared the time to restore various portions of a plume across all the alternatives. IAGWSP will review that slide format.

The next slides shown were graphs of Alternative 4 Mass of Dissolved RDX > 0.6 ppb; Alternative 4 Maximum RDX Concentration; and Alternative 4 Predicted RDX Concentration in System Influent.

Alternative 4 Summary: effectiveness for groundwater prevents further migration of upgradient plume (> 0.6 ppb) beyond Spruce Swamp Road; 77% reduction in plume volume (> 0.6 ppb) at 2040; 98% reduction in plume volume (> 2 ppb) at 2040; containment controls long-term impact from potential persisting and future sources. Soil remediation reduces potential for migration of COCs to groundwater. The implementability portion of the evaluation for groundwater considers piping over ~1.5 miles of varying terrain and the large dilute plume. Implementability issues for soil include the dangers of working in the impact area, logistics of remediating 24 acres, and impacting of up to 24 acres of habitat.

Alternative 3 is partial source removal, 24 acre alternative coupled with varied well configurations at the areas of higher concentration.

Alternative 3.1 assumes utilization of existing pumping well (PW-1) on Turpentine Road that was installed as part of the pumping test; no additional soil remediation; and natural attenuation of the plume outside the area of higher concentration. This is a fairly easy implementable alternative because the well already exists. The next slide shows the location of the existing extraction well, the proposed injection wells, and treatment system. The Alternative 3.1 system design is one extraction well, two reinjection wells, and one treatment plant at a pumping rate of 500 gpm (0.72 mgd). The plume never fully detaches but there is a fairly significant effect on the plume volume greater than 2 ppb.

The next slides shown were graphs of Alternative 3.1 Plume Projections after ten years, 30 years, and 60 years; Volume of RDX Plume (> 0.6 ppb and 0.2 ppb); Mass of Dissolved RDX (> 0.6 ppb); Maximum RDX Concentration; and Predicted RDX Concentration in System Influent.

Alternative 3.1 Summary: effectiveness for groundwater is 28% reduction in plume volume (> 0.6 ppb) @ 2040; 43% reduction in plume volume (> 0.6 ppb) @ 2070; 75% reduction in plume volume (> 2 ppb) @ 2070; containment controls long-term impact from majority of potential persisting and future sources; effective capture of more concentrated portions of the plume. This alternative is readily implemented because it uses an existing extraction well and with piping of ~0.5 mile.

Alternative 3.2 design considerations are soil remediation in 2010 (24 acres); containment of persisting source areas; collapse areas of higher concentrations; allows natural attenuation to address areas outside of those areas of higher concentrations; two variants within this Alternative (3.2a and 3.2b).

Alternative 3.2a system design has 11 extraction wells, six reinjection wells, and one treatment plant and pumps at a cumulative pumping rate of 1,100 gpm (1.6 mgd). Alternative 3.2b system design has eight extraction wells, five reinjection wells, and one treatment plant at a cumulative pumping rate of 850 gpm (1.2 mgd).

Alternatives 3.2a and 3.2b are not significantly different; Alternative 3.2a has more wells and is a bit more aggressive. The next two slides showed the fate of the plume after ten years, 30 years, and 60 years for Alternatives 3.2a and 3.2b. It appears at the end of both 30 and 60 years there is a big effect on the plume from both alternatives.

The next slides were Alternative 3.2 RDX Plume Volume (> 0.6 ppb and 2.0 ppb); Dissolved RDX Mass (> 0.6 ppb); Maximum RDX Concentration; and Predicted RDX Concentration in System Influent for Alternatives 3.2a and 3.2b.

Cost Summaries were presented for all the Alternatives. The same approach was used for all the alternatives using CERCLA guidance on costing.

Alternative 3.2 Summary: effectiveness for groundwater is there is little difference in performance between 3.2a and 3.2b; 87% reduction in plume volume (> 0.6 ppb) @ 2040; 96% reduction in plume volume (> 0.6 ppb) @ 2070; 97% reduction in plume volume (> 2 ppb) @ 2040; containment controls long-terms impact from majority of potential persisting and future sources; and effective capture of more concentrated portions of the plume. Soil remediation reduces potential for migration of COCs to groundwater.

Implementability issues for groundwater include piping over as much as four miles of topography in the impact area; wells capture groundwater from areas of higher concentration. For soil, there are dangers of working in the impact area; logistics of remediating 24 acres; and habitat issues.

The next steps in the series of presentations are agreement on Alternatives 3 and 4, regulatory agency input on screening alternatives, then publishing the FSSR.

Lynne Jennings (EPA) noted a concern of the breadth of remedial option evaluated by the IAGWSP as part of Alternative 3 and suggested that additional variants should be evaluated.

EPA's vision would be to evaluate additional alternatives addressing areas of the higher concentration and would involve more than one well at the source area.

It is IAGWSP's opinion that Alternative 3.2 provides effective options. Chris Abate (AMEC) stated that PW-1 is part of Alternatives 3.2a and 3.2b. The 3.2 design was approached in a three stage process. First stage, design what wells would be required in addition to PW-1 to contain the sources outside the 24 acres. Stage 2 – define what portion of the plume would attenuate within a reasonable amount of time without active pumping. Stage 3 was then to take the remaining parts of the aquifer - put wells in to capture/collapse those areas within a reasonable time frame. Alternative 3.2a was developed, and Alternative 3.2b is a refinement of 3.2a.

IAGWSP agrees that the concept of Alternative 3 (i.e. treatment of various areas of higher concentrations) is something that should be carried forward for detailed analysis.

EPA wants to have this scoped out in more detail before running the detailed analysis, for example write the screening report saying this category would be retained and other variants of this alternative may be considered in the FS.

Ms. Jennings said the EPA team reviewed the last presentation (Screening Approach) and some significant comments were voiced. These comments will be worked through the EPA

team first. Some of the comments were: 1) EPA isn't happy with the remedial action objectives (RAOs), these may need to be modified. 2) EPA is concerned with the evaluation part of the report and wants to ensure the EPA team comments are being addressed when evaluating alternatives; and there is concern this is not being done in accordance with the Administrative Orders.

Southeast Ranges/Windsong Road Status – Dave Hill

IAGWSP anticipates the authorization granted the Town Administrator to retain this property will be signed on 25 September at the Town meeting. The deed will then go to land court to be recorded. The best case scenario is it will be completed at the end of the month.

Revised Combined Schedule (RCS) – Ben Gregson

Mr. Gregson handed out hard copies of the September quarterly update of the RCS and requested the regulatory agencies to review and send comments to him as soon as possible. The most significant changes involve the delivery date for the draft RI/FS reports for the Southeast Ranges groundwater operable units.

Small Arms Ranges (SAR) Drilling Locations

Drilling will begin on Wednesday (20 September) for three projects on the SARs: Camp Edward's Pollution Prevention – two locations; IAGWSP SAR program - three different ranges with six different wells; and the Tungsten Study Program.

Results of a conference call among EPA, MassDEP, and EMC held last week: EPA requests a review of two issues simultaneously: 1) whether one well at Tango Range and Echo Range is sufficient for both P-2 and characterization; and 2) to look more broadly at the SAR Workplan to determine if the worst case ranges are being identified and if all other factors are being considered (are the right ranges being chosen to get full characterization at the starting point on the groundwater). EPA is also reviewing a collection of criteria to consider when answering the broader question of whether the right ranges are being investigated (existing soil data; range history – what is known and how old the ranges are; general coverage around the base including depth to groundwater; proximity to public water supplies; range construction (are there berms and what [rifles/pistols] was used at that location)). EPA is looking at different factors and evaluating the different ranges. EPA is not far from what was proposed by COL FitzPatrick; however, there are some ranges EPA thinks need to be evaluated.

Tango Range

EPA reviewed existing soil data including historical data where there were some lead concentrations in exceedence of the State's standard that are of concern. EPA feels Tango would be a good range for groundwater characterization due to the proximity to public supply well (downgradient), a good record of the number of shots fired, etc. EPA does not feel one well is sufficient. The P-2 well proposed by COL FitzPatrick is a good location to capture future activities (centrally located downgradient of where the STAPP system is going to be); however, EPA requests an additional well for a groundwater characterization effort. Before making final decisions, EPA wants to consider issues such as where the most likely drop zone would be; if there was any flyover; Tango did not have any berms; a surface danger zone to show where the high concentrations are. COL FitzPatrick will review the historical information (location of trees and firing line) and provide to EPA.

Approval was given for COL FitzPatrick to move forward on the one pollution prevention well. EPA may request a location for an additional well for groundwater characterization after reviewing additional information on range use.

Former R Range

This range is not a high priority range at this time.

Cluster of Echo/Bravo/Charlie/Current A Ranges

Bravo Range: Paul Nixon described the difficulties experienced during drive point sampling at B Range and the other locations and how samples sometimes needed to be collected as the drive point was retracted instead of on the way down as is preferred. This was apparently due to tight soil formations and/or silt around the slots in the sampler. Post-meeting correction: It was mistakenly implied during the meeting that this was done at DP-7, however no samples could be collected from that location because the down-hole equipment was damaged beyond repair during drilling. Mr. Nixon will have the drive point data package for EPA today.

IAGWSP's proposal for well location plan is the original plan (dated 08/04/2006). BP-1 will be sampled. May be installed next week BP-2C is the contingency well. Probably won't install a well at this time unless there is detection on the first one.

Status of MW-72 and drive point – CRREL will review.

Charlie Range: EPA suggested tabling for further discussions on Bravo.

IAGWSP said one well was originally proposed for Charlie Range and since all the samples collected from Bravo Range were NDs for tungsten, there isn't any reason to change the proposed location for Charlie. The one well proposed for Charlie per the AEC Tungsten Study is located downgradient of the highest use position of the range, as close as possible to the berm without actually being on the range.

Echo Range: EPA is satisfied for both perspectives in terms of location and characterization, and for P2.

Former B/Former C/Former D Ranges:

Former B: EPA reported the historical results and use history were reviewed. There were high concentrations (exceedences in the State's method); plus the range has an older use history (most recent information is from the 1930's); it has a varied history as being used for firing of small arms and used as a mortar position at one point; and its proximity to the boundary of the base; it might be worthy of including groundwater characterization there. This was not identified in the SAR Workplan but EPA proposes it be included for additional groundwater characterization. IAGWSP asked about timing and EPA does not request a response next week. Mr. Nixon did note that Former B is in the moraine, which may prove difficult for the auger rig to drill.

Former B and Former D Ranges: EPA suggests having a follow-up discussion to compare these ranges more carefully with regard to what is known about the history, concentration, and the well with respect to where it is sited in relation to the range activities. This would require more data on Former D and that well location before making a decision. IAGWSP will provide information on the last time groundwater was sampled in Former D.

Former C Range: Will review later.

Current G Range: IAGWSP proposed one well downgradient of the firing line and berm area. EPA is satisfied with that proposal. There are three wells there as part of Demo 1.

H Range: EPA skipped past H Range because they feel G Range is preferable in that general area.

I, J, K and KD Ranges:

J and K Ranges: IAGWSP is proposing two wells at J Range and two at K Range as they were amongst the highest use ranges. EPA is satisfied with the selection of J and K, however, not satisfied with the well selections. EPA is concerned there is too much trying to be accomplished and that some of the areas of concern are being missed. Mr. Nixon agreed that since two borings are needed for two well settings because 2 wells can't fit in the same hole, we might as well alter the plan to place individual wells in the optimal locations. He suggested taking the deeper one that is meant for monitoring K Range and moving it to K Range and making it a shallow well. A well will be placed to represent the middle to backstop berm; and the J Range well will be moved to the north approximately 20 ft to get a better characterization of J Range backstop.

Mark Begley (EMC) stated the southern most well on the J Range is a good location for the firing position on J. The proposal called for a southern cluster of wells on J Range. The deeper well will be eliminated leaving just the shallow setting to monitor the firing position for J Range. The well at the K Range firing line is well positioned due to former propellant detections there.

IAGWSP will provide a revised figure with the new drilling locations prior to drilling.

KD and M Ranges: EPA skipped because these are not high priority ranges.

N/O and P Ranges:

There are many wells for the J Range; the plan is to review what wells are there, what they have been sampled for, and then decide if a well should be installed. Oscar Range has the highest recent use; there has been a lot of shotgun use there.

IAGWPS will review existing wells and respond to EPA.

Sierra East and West:

IAGWSP gave results of the Tungsten Study – the only tungsten detect in the entire drivepoint program is at DP-2, the first one down range had a tungsten detect at the first interval (0-2.5 ft below grade), the samples were filtered (0.6) and unfiltered (1.1). Everything else was ND. There is no data for DP-3 and DP-4. Keep in mind these are drivepoint samples and not developed monitoring well samples that are usually used to characterize water. They are very silty and the unfiltered samples could be affected by that.

Mr. Nixon will provide EPA an "as built" of where the drivepoints are located.

Three wells are planned at Sierra Range as part of the tungsten study: DP-5 will monitor the old range, the new range and firing point; DP-2 had tungsten detect; hold off on the third well until more data are received on T Range bullet drop zone to determine what is necessary downgradient of Sierra. MassDEP and EPA agreed.

EPA: Suggests first P-2 wells – one at Echo and one at Tango. (May still need more wells at Tango). Priority is to get everything in at Tango and get sampled before firing begins.

RESULTS:

Start drilling seven wells next week:
Echo – one pollution prevention well
Tango – one pollution prevention well
Bravo – one Tungsten Study well
Charlie - one Tungsten Study well
Golf – one IAGWSP well
Juliet- two IAGWSP wells
Kilo- two IAGWSP wells.
Sierra – two wells with a third location to be determined

Pending:

One on Tango – Waiting for COL FitzPatrick to review historical data
November/Oscar/Papa- review existing well data for N/O/P; determine if a well is needed
Former Bravo- choose a location
Former Delta – Check MW-174 data
The pending issues will be discussed at the next Tech meeting.

Northwest Corner RI – Discussion of EPA/DEP Comments

The major issue is how to split the different overlapping datasets for risk characterization purposes. Mr. Gallagher maintains the way it was done in the RI Report was the most logical.

Another issue is why the post fireworks data collected on the 7th are not being included in the risk characterization. Mr. Gallagher noted those data were not included for several reasons; the primary reason is IAGWSP does not think it represents site conditions at the time the risk characterization was done.

Another issue is sampling depths. EPA and MassDEP both commented that samples were not collected below what is considered surface soil sample depths. Mr. Gallagher noted there is indication in the comments that there is an expectation from EPA and MassDEP that IAGWSP should further characterize soil in the Northwest Corner.

Mr. Gallagher noted that all data were reported but the risk characterization was done for data collected for perchlorate and explosives (RDX) characterization. There is a miscellaneous dataset that was included in the Northwest Corner risk assessment. These samples were collected at the request of EPA because of the concern that perchlorate may be coming from smoke canisters used along Canal View Road (five samples total analyzed SVOC, dyes and metals). The idea was to find an indicator compound that would suggest that the perchlorate plume was the result of smoke canisters (hexachloroethane was something EPA identified). IAGWSP had samples collected and none of the target analytes were found, however several other compounds (PAHs and certain metals) were. Basically, this data did not fit neatly into an existing OU. Therefore, IAGWSP decided to place that data into the Northwest Corner risk assessment. This discussion is a preview of what will be in the Response to Comments. Mr. Gonser (IAGWSP) suggests putting it in the document but not the risk assessment.

Another significant issue was Phase I groundwater analytes. Prior to the Northwest Corner investigation the IAGWSP sampled all new and existing wells for a lengthy analyte list. This sampling wasn't done because of known releases of these contaminants but simply because the nature of potential contamination from activities that occurred at MMR was not well known. Thus analytes other than explosives and perchlorate were detected in some of these wells. The majority of these analytes were metals that are likely naturally occurring. The remaining

compounds, with the exception of chloroform, were infrequently detected at low concentrations. Chloroform is ubiquitous in the groundwater on Cape Cod and not related training activities. Thus the IAGWSP does not believe that further investigation of these analytes as part of the Northwest Corner OU is necessary.

With respect to breaking up the overlapping data, Mr. Gallagher recommends addressing the shallow perchlorate plume and all RDX detections in the Northwest Corner feasibility study. The RDX plume will be truncated at the southeastern edge of GP-19 for the purposes of the feasibility study. This location corresponds with the upgradient edge of the higher RDX concentrations. The complete recommendation for breaking up the overlapping data will be articulated in the RCL. The RCL is due to EPA and MassDEP on 28 September. EPA and MassDEP will review and discuss with their risk assessors.

IART Meeting for September 2006

The EPA convened a meeting of the Impact Area Groundwater Review Team on September 26, 2006. The agenda included the J-2 and J-3 Range groundwater treatment systems, Small Arms Ranges investigation, Central Impact Area (CIA) recent results, Former K Range supplemental remedial investigation, and the CIA Feasibility Study Screening Report status.

3. SUMMARY OF DATA RECEIVED

Validated Data

Table 4 (sorted by analyte) summarizes the detections, since 1997, that equaled or exceeded an EPA Maximum Contaminant Level (MCL), MassDEP MCL (MMCL) or Health Advisory (HA) for drinking water. Table 4 is updated on a monthly basis; discussions in the text are updated on the same schedule as Figures 1 through 8, which are discussed later in this section.

Table 5 summarizes first-time validated detections of explosives and perchlorate below the MCL/MMCL/HA for drinking water received from August 25, 2006 through September 29, 2006. First-time validated detections of VOCs, SVOCs, herbicides and pesticides are included and discussed quarterly in the March, June, September, and December Monthly Progress Reports. Metals, chloroform, and bis (2-ethylhexyl) phthalate (BEHP) are excluded from Table 5 for the following reasons: metals are a natural component of groundwater, particularly at levels below MCLs or HAs; detections of chloroform are pervasive throughout Cape Cod and are not likely the result of military training activities; and BEHP is believed to be largely an artifact of the investigation methods and introduced to the samples during collection or analysis.

Figures 1 through 8 depict the cumulative results of groundwater analyses for the period from the start of the Impact Area Groundwater Study (July 1997) to the present. Each figure depicts results for a different analyte class:

- Figure 1 shows the results of explosive analyses by EPA Method 8330. This figure is updated and included each month.
- Figure 2 shows the results of inorganic analyses (collectively referred to as "metals", though some analytes are not true metals) by methods E200.8, 300.0, 350.2M, 353M, 365.2, CYAN, IM40MB, IM40MBM, and IM40HG. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 3 shows the results of Volatile Organic Compound (VOC) analyses by methods OC21V, OC21VM, 504, 8021W, and SW8260 exclusive of chloroform detections. This

figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.

- Figure 4 shows the chloroform results using the Volatile Organic Compound (VOC) analyses by method OC21V and OC21VM. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 5 shows the results of Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270, exclusive of detections of BEHP. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 6 shows the BEHP results using the Semi-Volatile Organic Compound (SVOC) analyses by methods OC21B and SW8270. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 7 shows the results of Pesticide (method OL21P) and Herbicide (method 8151) analyses. This figure is updated and included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 8 shows the results of Perchlorate analysis by method E314.0. This figure is updated and included each month.

The concentrations from these analyses are depicted in Figures 1 through 7 compared to Maximum Contaminant Levels (MCLs) or Health Advisories (HAs) published by EPA for drinking water. For Figures 1 through 7, a red circle is used to depict a well where the concentration of one or more analytes was greater than or equal to the lowest MCL or HA for the analyte(s). A yellow circle is used to depict a well where the concentration of all analytes was less than the lowest MCL or HA. A green circle is used to depict a well where the given analytes were not detected in groundwater samples. For Figure 8, a red circle is used to depict a well where the concentration of perchlorate was greater than or equal to 24 ppb (EPA's Drinking Water Equivalent Level (DWEL) derived from the 2005 National Academy of Science (NAS) report). An orange circle is used to depict a well where the concentration of perchlorate is above 2 ppb (the Massachusetts MCL (MMCL)) and below 24 ppb. A yellow circle is used to depict a well where the concentration of perchlorate was less than 2 ppb. A green circle is used to depict a well where perchlorate was not detected in groundwater samples. For all figures, an open circle is used to depict a proposed well where the analytes in question for example, Explosives in Figure 1, have not yet been quantified. A black circle represents a well that has been sampled for analytes, but validated groundwater data is not yet available.

There are multiple labels listed for some wells in Figures 1 through 8, which indicate multiple well screens at different depths throughout the aquifer. The aquifer is approximately 200 to 300 feet thick in the study area. Well screens are positioned throughout this thickness based on various factors, including the results of groundwater profile samples, the geology, and projected locations of contaminants estimated by groundwater modeling. The screen labels are colored to indicate which of the depths had the chemical detected above drinking water standards. Generally, groundwater entering the top of the aquifer will move deeper into the aquifer as it moves radially outward from the top of the water table mound. Light blue dashed lines in Figures 1 through 8 depict water table contours. Groundwater generally moves perpendicular to these contours, starting at the center of the 70-foot contour (the top of the mound) and moving radially outward. The rate of vertical groundwater flow deeper into the aquifer slows as groundwater moves away from the mound.

The results presented in Figures 1 through 8 are cumulative, which provides a historical perspective on the data rather than a depiction of current conditions. Any detection at a well that equals or exceeds the MCL/DWEL/HA results in the well having a red symbol, regardless of

later detections at lower concentrations, or later non-detects. The difference between historical and current conditions varies according to the type of analytes. There are little or no differences between historical and current exceedances of drinking water criteria for Explosives, Perchlorate, VOCs, Pesticides, and Herbicides; the minor differences are mentioned in the following paragraphs. There are significant differences between historical and current exceedances of drinking water criteria for Metals and SVOCs, as described further below.

Figure 1: Explosives in Groundwater Compared to MCLs/HAs

For data validated in September 2006, no wells had a first-time validated detections of explosives above the MCL/HA. One well, MW-441M1 (Impact Area), had a first-time validated detection of RDX below the HA of 2 ppb.

Exceedances of drinking water criteria for explosive compounds are indicated in six general areas:

- Demo Area 1 (wells 19, 31, 34, 73, 76, 77, 114, 129, 165, 210, and 211);
- Demo Area 2 (wells 16, 160, 259, 262, and 404);
- The Impact Area and CS-19 (wells 58MW0001, 58MW0002, 58MW0009E, 58MW0011D, 58MW0016B, 58MW0016C, 58MW0018B; and wells 1, 2, 23, 25, 37, 38, 40, 43, 85, 86, 87, 88, 89, 90, 91, 93, 95, 98, 99, 100, 101, 105, 107, 111, 112, 113, 176, 178, 184, 201, 203, 204, 206, 207, 209, 223, 235, OW-1, OW-2, and OW-6);
- J Ranges and southeast of the J Ranges (wells 45, 58, 130, 132, 147, 153, 163, 164, 166, 171, 191, 193, 196, 198, 215, 218, 227, 232, 234, 247, 265, 289, 303, 306, 324, 326, 343, 346, 360, 368, 398, and wells 90MW0022, 90MW0041, 90MW0054 and 90WT0013).
- Landfill Area 1 (wells 27MW0018A, 27MW0020A, and 27MW0020B); and
- Northwest Corner of Base Boundary (well 323)

Exceedances of drinking water criteria were measured for TNT at Demo Area 1 (wells 19S, 31S, 31M, and 31D) and Southeast of the Ranges (196S). Exceedances of the HA for RDX were noted at all of the locations listed above except at MW-45, MW-196, and the LF-1 wells. Exceedances of drinking water criteria were measured for 2,6-dinitrotoluene (2,6-DNT) at MW-45S. Exceedances of drinking water criteria were measured for 1,3-dinitrobenzene at LF-1 wells 27MW0018A, 27MW0020A and 27MW0020B.

Demo Area 1 has a single well-defined source area and extent of contamination. The estimated extent of RDX exceeding the HA at Demo Area 1 based on the most recent groundwater measurements is indicated by a magenta concentration contour line on Figure 1 and Inset A.

Demo Area 2 has five groundwater exceedances of the RDX HA at MW-16S, MW-160S, MW-259, MW-262M1, and MW-404M2. The extent of the contamination is currently under investigation.

The Impact Area has a plume defined by RDX concentrations above the HA of 2 ppb. The plume originates primarily along Turpentine Road and extends downgradient to the west-northwest. Another source of RDX in the Impact Area is CS-19. Portions of CS-19 are currently under investigation by the Air Force Center for Environmental Excellence (AFCEE) under the Superfund program. The extent of RDX has largely been defined in the Impact Area and the investigation phase of the project is nearing completion.

The J Ranges and downgradient areas have five groundwater plumes defined by concentrations of RDX above the HA of 2 ppb. The five plumes originate at the J-1 Range Interberm Area (northern plume in the vicinity of MW-58 and MW-265), the J-2 Range North plume (northern plume extending from MW-130), the J-2 Range East plume (eastern plume including MW-215), the J-3 Range Demolition Area (southern plume extending from MW-163 south to Snake Pond) and the L Range (in an area defined by MW-147 and MW-153 at Greenway Road). In addition, RDX detections at MW-398M2 suggest a possible plume at the south end of the J-1 Range. All the J ranges and the L Range are currently under investigation and the plumes will be updated and refined as new validated data is received.

The Northwest Corner of the base boundary has one validated detection of RDX in groundwater above the HA of 2 ppb at MW-323M2. The M1 screen in this location has a validated detection of RDX in groundwater below 2 ppb.

Figure 2: Metals in Groundwater Compared to MCLs/HAs

For data validated between June 2006 and September 2006, no wells had first-time validated detections of metals above the MCL/HAs. Six wells had first-time validated detections of various metals below the MCL/HAs.

Exceedances of drinking water criteria for metals are scattered throughout the study area. Where two or more rounds of sampling data are available, the exceedances generally have not been replicated in consecutive sampling rounds. The exceedances have been measured for antimony, arsenic, cadmium, chromium, lead, molybdenum, sodium, thallium and zinc. Exceedances of the arsenic drinking water criteria were repeated at three (wells 58MW0010A, MW-7M1 and MW-45S) of the six locations with arsenic exceedances. At the remaining three locations (wells MW-3D, MW-52M2 and MW-152M1), arsenic exceedances were not repeated in subsequent results. Cadmium (well MW-52M3) and chromium (well MW-7M1) were each detected above drinking water criteria in a single sampling round in August-September 1999. Exceedances of the drinking water criteria for lead were repeated at two of four locations (wells ASP and MW-45S). At the remaining two locations (wells MW-2S and MW-7M1) lead exceedances were not repeated in subsequent results. Exceedances of the drinking water criteria for molybdenum were repeated at two of eight locations (wells MW-53M1 and MW-54S) with molybdenum exceedances. All of the molybdenum exceedances were observed in year 1998 and 1999 results. Exceedances of the drinking water criteria for sodium were repeated at 12 of the 21 locations with sodium exceedances (wells MW-2S, MW-21S, MW-46S, MW-57M3, MW-57M2, MW-57M1, MW-144S, MW-145S, MW-148S, MW-187D, ASP and SDW261160). Seven wells (MW-21S, MW-57M1, MW-57M3, MW-187D, BHW215083B, BHW215083D and ASP) had sodium exceedances in year 2004, 2005, and/or 2006 results. Zinc exceeded the HA in seven wells, all of which are constructed of galvanized (zinc-coated) steel.

There have been few exceedances of drinking water limits for antimony and thallium since the introduction of the ICP/GFAA and ICP/MS methods, discussed in the next paragraph. None of the 13 locations with antimony exceedances had repeated exceedances and only one exceedance (well MW-38M2) was measured since January 2003. Eleven of the 72 locations with thallium exceedances had repeated exceedances in subsequent sampling rounds (wells MW-7M1, MW-19S, MW-45S, MW-47M2, MW-47M3, MW-52S, MW-52D, MW-54S, MW-54M1, MW-58S and MW-94M2). There have been no exceedances of thallium since January 2003.

Groundwater samples sent for metals analysis are analyzed for most metals by Inductively Coupled Plasma (ICP) in accordance with U.S. EPA Contract Laboratory Program Statement of

Work ILM04.0. In May of 2001, the IAGWSP began analyzing for antimony and thallium using the GFAA (graphite furnace atomic adsorption) method in accordance with EPA Drinking Water Methods 204.2 (antimony) and 279.2 (thallium) in order to achieve lower detection limits for these metals. Both the ILM04.0 and GFAA methods are subject to false positive results at trace levels due to interferences. As a result, the IAGWSP changed to a new method to achieve lower detection limits for antimony and thallium in January of 2003. Groundwater samples are now analyzed for antimony and thallium by Inductively Coupled Plasma/Mass Spectroscopy (ICP/MS) in accordance with the EPA Method 6020. The ICP/MS Method 6020 has greater sensitivity and the added feature of selectivity for antimony and thallium. These additional methods achieve lower detection limits for these two metals and reduce the number of false positive results.

The distribution and lack of repeatability of the metals exceedances is not consistent with a contaminant source, nor do the detections appear to be correlated with the presence of explosives or other organic compounds. The IAGWSP evaluated inorganic background concentrations using the groundwater quality database of 1999, and submitted a draft report describing background groundwater quality in December 1999.

Figure 3: VOCs in Groundwater Compared to MCLs/HAs

For data validated between June 2006 and September 2006, no wells had first-time validated detections of VOCs above MCL/HAs. Three wells, MW-392D (J-3 Range) and MW-436M1 & M2 (J-2 Range), had first-time validated detections of chloromethane below the MCL/HA of 30 ppb. One well, MW-80M2 (Western Boundary), had a first-time validated detection of acetone. One well, MW-398M1 (J-1 Range), had a first-time validated detection of carbon disulfide. Five wells, MW-233M3, MW-80S, M3, & M2, and MW-82M2 (Western Boundary), had first-time validated detections of methyl ethyl ketone. MCL/HAs have not been established for acetone, carbon disulfide, or methyl ethyl ketone.

Exceedances of drinking water criteria for VOCs are indicated in six general areas: Northeast Corner (well LRMW003), Impact Area boundary (MW-28S), CS-10 (wells 03MW0007A, 03MW0014A, and 03MW0020), LF-1 (well 27MW0017B), FS-12 (wells MW-45S, 90MW0003, and ECMWSNP02D), and in the J-1 Range (well MW-187D). CS-10, LF-1, and FS-12 are sites located near the southern extent of the Training Ranges that are currently under investigation by AFCEE under the Superfund program. Exceedances of drinking water criteria were measured for tetrachloroethylene (PCE) at CS-10, for vinyl chloride at LF-1, and for methylene chloride, toluene, 1,2-dichloroethane, and ethylene dibromide (EDB) at FS-12. These compounds are believed to be associated with the sites under investigation by AFCEE. Detections of benzene, tert-butyl methyl ether, and chloromethane at J-1 Range well MW-187D, chloromethane at Northeast Corner well LRMW003, and 1,2-dibromo-3-chloropropane at Impact Area boundary well MW-28S are currently under investigation.

Figure 4: Chloroform in Groundwater Compared to MCLs

Chloroform has been widely detected in groundwater across the Upper Cape as stated in a joint press release from USEPA, MassDEP, IRP, and the Joint Programs Office. The Cape Cod Commission (2001) in their review of public water supply wells for 1999 found greater than 75% contained chloroform with an average concentration of 4.7 ug/L. The IRP has concluded chloroform is not the result of Air Force activities. A detailed discussion of the presence of chloroform is provided in the Final Central Impact Area Groundwater Report (06/01). To date, the source of the chloroform in the Upper Cape groundwater has not been identified.

Figure 5: SVOCs in Groundwater Compared to MCLs/HAs

For data validated between June 2006 and September 2006, no wells had first-time validated detections of SVOCs above or below the MCL/HAs.

Exceedances of drinking water criteria for SVOCs are scattered throughout the study area. All exceedances of drinking water criteria for SVOCs were measured for bis (2-ethylhexyl) phthalate (BEHP), with the exception of two wells. MW-264M1 (J-3 Range) had a detection of benzo(a)pyrene at concentrations of more than twice the HA and MW-241M1 (L Range) had detections of naphthalene above the HA of 100 ppb. Detections of BEHP are presented separately in Figure 6 and discussed in the next paragraph.

Figure 6: BEHP in Groundwater Compared to MCLs

Exceedances of drinking water criteria for bis (2-ethylhexyl) phthalate (BEHP) are scattered throughout the study area. BEHP is believed to be largely an artifact of the investigation methods, introduced to the samples during collection or analysis. However, the potential that some of the detections of BEHP are the result of activities conducted at MMR has not been ruled out.

A detailed discussion of the presence of BEHP is provided in the Draft Completion of Work Report (7/98) and subsequent responses to comments. The theory that BEHP mostly occurs as an artifact, and is not really present in the aquifer, is supported by the results of subsequent sampling rounds that show much lower levels of the chemical after additional precautions were taken to prevent cross-contamination during sample collection and analysis. Only four locations (out of 90) showed BEHP exceedances in consecutive sampling rounds: 28MW0106 (located near SD-5, a site under investigation by AFCEE), 58MW0006E (located at CS-19), and 90WT0013 (located at FS-12), and MW-146M1 (located at L Range). Subsequent sampling rounds at all these locations have had results below the MCL. Eleven wells (27MW0705, 27MW2061, C2-B, C6-C, C7-B, MW-47M2, MW-164M1, MW-168M1, MW-188M1, MW-196M1, and MW-198M1) had BEHP exceedances in the year 2002 and 2003 results. There have been no exceedances of BEHP in 2004 and one exceedance of BEHP, at MW-356M1 (J-3 Range), in 2005.

Figure 7: Herbicides and Pesticides in Groundwater Compared to MCLs/HAs

For data validated between June 2006 and September 2006, no wells had first-time validated detections of herbicides or pesticides above or below the MCL/HAs.

There has been one exceedance of drinking water criteria for pesticides, at well PPAWSMW-1. A contractor to the United States Air Force installed this monitoring well at the PAVE PAWS radar station in accordance with the Massachusetts Contingency Plan (MCP), in order to evaluate contamination from a fuel spill. The exceedance was for the pesticide dieldrin in a sample collected in June 1999. This well was sampled again in November 1999. The results of the November sample indicate no detectable pesticides although hydrocarbon interference was noted. It appears from the November sample that pesticides identified in the June sample were false positives. However, the June sample results cannot be changed when following the EPA functional guidelines for data validation. The text of the validation report for the June sample has been revised to include an explanation of the hydrocarbon interference and the potential for false positives.

There has been one exceedance of drinking water criteria for herbicides, at well MW-41M1 (Impact Area). This response well was installed downgradient of the Impact Area. The exceedance was for the herbicide pentachlorophenol in a sample collected in May 2000. There were no detections above the MCL of this compound in the three previous sampling rounds in 1999, nor in the subsequent sampling rounds in 2000, 2001, 2002, and 2003.

Figure 8: Perchlorate in Groundwater Compared to a 2 ppb Concentration

For data validated in September 2006, no wells had first-time validated detections of perchlorate above the MMCL of 2 ppb. One well, MW-441M1 (Impact Area), had a first-time validated detection of perchlorate below the MMCL of 2 ppb.

Sampling and analysis of groundwater for perchlorate was initiated at the end of the year 2000 as part of the IAGWSP. Cumulative exceedances of the 2 ppb concentration of perchlorate are indicated in seven general areas:

- Demo Area 1 (wells 19, 31, 32, 33, 34, 35, 36, 73, 75, 76, 77, 78, 114, 129, 139, 162, 165, 172, 210, 211, 225, 258 and 341);
- Impact Area and CS-19 (wells 58MW0009C, 58MW0015; and wells 38, 89, 91, 93, 101, and OW-1);
- J Ranges and southeast of the J Ranges (wells 93, 125, 127, 128, 130, 132, 142, 143, 158, 163, 166, 193, 197, 198, 215, 232, 234, 237, 243, 247, 250, 263, 265, 286, 289, 293, 295, 300, 302, 303, 305, 307, 310, 313, 319, 321, 324, 326, 329, 339, 343, 346, 348, 366, 368, 370, and wells 90PZ0211, 90MW0022 and 90MW0054, 90WT0013, and RS003P);
- Landfill Area 1 (27MW0031B);
- CS-18 (well 16MW0001); and
- Northwest Corner of Base Boundary (wells 4036009DC, 66, 270, 277, 278, 279, 283, 284, 287, 297, 301, 309, 323, and RSN0W3).
- Western Boundary (wells 80, 233, and 267)

Demo Area 1 has a single well-defined source area and extent of contamination. The downgradient extent of the perchlorate plume has been determined with the installation of monitoring wells along the power line right-of-way east of Fredrickson Road.

The Impact Area has eight locations with exceedances of the 2 ppb concentration of perchlorate. The perchlorate plume extends from near the center of the Impact Area to the northwest, in the vicinity of Burgoyne Road.

Plumes have been identified in four areas in the J Ranges. The J-1 Interberm perchlorate plume has several perchlorate detections in downgradient locations MW-265, MW-286, MW-303, MW-326, MW-346, and MW-370. The J-3 Range Demolition perchlorate plume has detections in several wells immediately downgradient of the source area, which is centered at MW-198, and further downgradient centered near location 90MW0054. The J-2 Range North perchlorate plume has detections at source area locations MW-130 and MW-263, and downgradient locations MW-289, MW-293, MW-300, MW-302, MW-305, and MW-313. The J-2 East perchlorate plumes are in the process of delineation and include detections at MW-307, MW-310 and MW-368. There is a single perchlorate detection (well 90WT0013) at the L Range which exceeds the 2 ppb concentration.

The Northwest Corner has a perchlorate plume extending from Canal View Road at the base boundary to the Cape Cod Canal. This area is under investigation and the plume will be updated and refined as new data is received.

The LF-1 and CS-18 areas are under investigation by AFCEE in the Superfund Program.

The Western Boundary has three locations (wells 80, 233, and 267) which exceed the 2 ppb perchlorate MMCL.

Rush (Non-Validated) Data

Rush data are summarized in Table 6. These data are for analyses that are performed on a fast turnaround time, typically 1 to 10 days. Explosive analyses for monitoring wells, and explosive and VOC analyses for profile samples, are typically conducted in this timeframe. Other types of analyses may be rushed depending on the proposed use of the data. The rush data have not yet been validated, but are provided as an indication of the most recent preliminary results. Table 6 summarizes only detects, and does not show samples with non-detects.

The status of the detections with respect to confirmation using Photo Diode Array (PDA) spectra is indicated in Table 6. PDA is a procedure that has been implemented for the explosive analysis, to reduce the likelihood of false positive identifications. Where the PDA status is "YES" in Table 6, the detected compound is verified as properly identified. Where the status is "NO", the identification of an explosive has been determined to be a false positive. Where the status is blank, PDA has not yet been used to evaluate the detection, or PDA is not applicable because the analyte is a VOC. Most explosive detections verified by PDA are confirmed to be present upon completion of validation.

In September, there was either no rush data received or it was non-detect for all analytes, therefore Table 6 is not included in this report.

4. DELIVERABLES SUBMITTED

Deliverables submitted during the reporting period include the following:

Monthly Progress Report # 113 for August 2006 09/08/2006

5. SCHEDULED ACTIONS

Figure 9 provides a Gantt chart updated as of June 4, 2006, to reflect progress and proposed work. The following documents are scheduled to be submitted in October and early November:

- Western Boundary Final Remedial Investigation Report
- Gun and Mortar Groundwater and Soil Final Remedial Investigation Work Plan
- Small Arms Range Draft Rapid Response Action Work Plan

The following documents are being prepared or revised during October and early November:

- J-1 Range Soil Draft Remedial Investigation Report
- J-1 Range Southeast Groundwater Draft Remedial Investigation/Feasibility Study Report
- J-1 Range North Groundwater Draft Remedial Investigation/Feasibility Study Report
- J-1 Range Southeast Groundwater Draft Rapid Response Action Report
- J-2 Range Soil Draft Remedial Investigation Report

- J-2 Range Groundwater Draft Remedial Investigation/Feasibility Study Report
- J-3 Range Groundwater Draft Remedial Investigation/Feasibility Study Report
- L Range Groundwater Draft Feasibility Study Report
- Central Impact Area Soil Draft Remedial Investigation Report
- Central Impact Area Soil and Groundwater Draft Feasibility Study Screening Report
- Northwest Corner Draft Feasibility Study Report
- Demo 2 Groundwater Draft Remedial Investigation/Feasibility Study Report
- Former A Range Final Remedial Investigation Report
- Former K Range Final Remedial Investigation Report
- Ammunition Supply Point Draft Rapid Response Action Completion of Work Report
- Small Arms Range Draft Remedial Investigation Report
