

**MONTHLY PROGRESS REPORT #134
FOR MAY 2008**

EPA REGION I ADMINISTRATIVE ORDERS SDWA 1-97-1019 and 1-2000-0014

**MASSACHUSETTS MILITARY RESERVATION
TRAINING RANGE AND IMPACT AREA**

The following summary of progress is for the period from 01 May to 31 May 2008.

1. SUMMARY OF REMEDIATION ACTIONS

The following is a description of Remediation Actions (RA) underway at Camp Edwards as of May 2008. Remediation actions may include Rapid Response Actions (RRA). An RRA is an interim action that may be conducted prior to risk assessments or remedial investigations to address a known, ongoing threat of contamination to groundwater and/or soil.

Demo Area 1 Comprehensive Groundwater RA

The Demo Area 1 Comprehensive Groundwater RA consists of the removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. Extraction, treatment, and recharge (ETR) systems at Frank Perkins Road and Pew Road include extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Pew Road ETR continues operation at a flow rate of 103 gallons per minute (gpm). A power outage caused the Pew Road system to shut down on 23 May 2008 at 7:10 AM. The system was restarted at 12:59 PM. As of 30 May 2008, over 46 million gallons of water have been treated and re-injected at the Pew Road ETR System.

The Frank Perkins Road ETR is operating at a flow rate of 808 gpm. A power outage caused the Frank Perkins system to shut down on 23 May 2008 at 7:10 AM. The system was restarted at 12:33 PM. As of 30 May 2008, approximately 716 million gallons of water had been treated and re-injected at the Frank Perkins Road ETR System. The RA system has treated 300 million gallons of the 716 million gallon total.

J-1 Range South Groundwater RRA

The J-1 Range South Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives. The ETR system includes a single extraction well, ex-situ treatment process to remove explosives from the groundwater, and an infiltration trench to return treated water to the aquifer.

Due to detection of RDX past the lead carbon vessels, the J-1 Range South system was shut down and drained on 30 April 2008 at 1:00 PM. Carbon change-out was performed on 1 May 2008. The J-1 Range South system was restarted on 2 May 2008 at 10:13 AM, and continues to operate at a flow rate of 75 gpm. As of 30 May 2008, approximately 24 million gallons of water have been treated and re-injected at the ETR System.

J-2 Range North Groundwater RRA

The J-2 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include

single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and infiltration basins to return treated water to the aquifer.

The mobile ETR units continue operation at a flow rate of 250 gpm and the building ETR continues operation at a flow rate of 125 gpm. As of 30 May 2008, approximately 222 million gallons of water have been treated and re-injected at the mobile ETR System and 108 million gallons of water have been treated and re-injected at the building ETR System.

J-3 Range Groundwater RRA

The J-3 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater and use of the existing Fuel Spill-12 (FS-12) infiltration gallery to return treated water to the aquifer.

The J-3 ETR system continues to operate at a flow rate of 195 gpm. As of 30 May 2008, approximately 141 million gallons of water have been treated and re-injected at the ETR System.

2. SUMMARY OF ACTIONS TAKEN

Samples collected during the reporting period are summarized in Table 2.

System performance monitoring groundwater samples were collected from J-3 Range. Process water samples were collected at Frank Perkins Road, Pew Road, J-2 Range North, J-3 Range and J-1 Range South treatment plants.

The Spring 2008 long term monitoring program continued in May; groundwater samples were collected from J-2 Range East, Former K Range, Northwest Corner, Gun & Mortar Positions, Residential Wells, J-1 Range North and Central Impact Area. Surface water samples were collected from Snake Pond and pore water samples were collected from lysimeters at Tango Range. Profile samples were collected during installation of a monitoring well at J-2 Range East.

Three BIP items were detonated at the J-3 Range on 22 May 2008. The following items were detonated: one 2.36 inch rocket, one 3.5 inch rocket and one 60 mm mortar. Pre- and post-BIP samples were collected from all three locations in accordance with the BIP sampling protocol.

Soil samples were collected at the Former B and Former D Ranges. Supplemental and post excavation soil samples were collected at BIP locations within the CIA and J-2 Range. These samples were collected in accordance with the BIP Sampling and Analysis Plan.

MMR IAGWSP Tech Meeting Minutes 05-15-2008

The following are notes from the 15 May 2008 Technical Team Meeting of the Impact Area Groundwater Study Program office at Camp Edwards.

J-2 North SPM Update/J-2 East Interim Groundwater Monitoring Plan Data (IGMP) 2007 Update – Mike Goydas, Katie Thomas

J-2 North: This portion of the update provides an overview of the J-2 North Plume SPM chemical monitoring results, plant performance, hydraulic monitoring results, plume shell update, system performance and next steps, covering data collected after the RI and as part of the first annual operational year of J-2 North. The J-2 East portion of the update provides a brief update of the chemical monitoring results and the next steps.

The chemical monitoring activities included interim sampling of all the wells in the monitoring plan (51 wells) after startup of the J-2 North system (Sept 2006); and SPM sampling of one semiannual round of 20 wells (Mar/Apr 2007) and one annual round of 64 wells (Sept/Oct 2007). The wells were sampled for perchlorate and RDX.

J-2 North SPM deviations include obstruction of MW-29. In the annual report, USACE will recommend deleting this well from monitoring. Another deviation was explosives were not analyzed at MW-296M2 (Sept 2007).

J-2 North Perchlorate Results

The upgradient wells indicate decreases or are consistent. MW-130S decreased to ND. Three wells remain consistent with historical results and one well continued to decrease. In the mid-plume area, there were increases and decreases. MW-300M2 increased before startup and then decreased; and there are decreases in all other wells and low concentrations at the new SPM wells. Downgradient wells are fairly consistent. Wells downgradient of the plume continue to be ND.

Insights for the J-2 North perchlorate plume show the conceptual model is consistent with previous depictions; the max concentration has decreased; there are decreases and consistent results in the upgradient portion; the core of the plume is migrating downgradient and is slightly larger than estimated in the RRA at the time of system startup; and there are subtle changes in 2 ug/L and 24 ug/L contours.

J-2 North RDX Results

Concentration decreased at upgradient well MW-130S; there was continued variability at MW-234M1 and continued decrease in the main body and deep lobe. The current plume maximum concentration is 4.1ug/L. Downgradient, there were decreases at all the monitoring wells along Wood Road; ND at MW-348M2 for two rounds.

Insights for the J-2 North RDX plume show the current conceptual model is consistent with previous depictions; there was a decrease in downgradient extent of the ND contour and a slight increase in extent of 2 ug/L contour.

J-2 North plant performance; SPM hydraulic assessment; and the analytical capture zone assessment were also discussed. New perchlorate and RDX plume shells representing September 2007 conditions including data from mid-2002 to September 2007 were shown and discussed. Different concentration cutoff summary for perchlorate and RDX were shown and compared to the previous plume shell.

Perchlorate and RDX animations were demonstrated, along with future predictions using the new plume shell and the new model. The animations will be included in the annual report. Also shown were future predictions using the new plume shell and the new model.

The next steps for J-2 North include no changes to system operation; minor hydraulic network revisions; maintain schedule for sampling; and developing an annual report after the September 2008 chemical and hydraulic sampling events.

J-2 East IGMP Activities include IGMP sampling and investigative sampling. The J-2 East IGMP sampling included one annual round of 24 wells and two semiannual rounds of 19 wells, with no deviations. The J-2 East investigative sampling included post-drilling monitoring well sampling of nine samples collected between June 2006 and December 2006. All wells were sampled for perchlorate and explosives; some wells were sampled for VOCs and SVOCs.

J-2 East Perchlorate Results

The J-2 East IGMP perchlorate results along the western lobe decreased or remained consistent; the main lobe upgradient wells showed decreases and consistency; and within the Eastern lobe there were decreases.

The J-2 East perchlorate results show the J-2 East perchlorate plume conceptual model is consistent with previous depictions; the concentrations in the Western Lobe have decreased; max concentration has decreased; there are decreases and consistent results in upgradient portion; the highest concentrations remain in the core of the plume; the plume is migrating downgradient; and the leading edge of the low concentrations in the Eastern Lobe is more easterly than previously depicted.

J-2 East RDX Results

The J-2 East IGMP RDX results in the Western Lobe show decreases and consistency; in the main Lobe upgradient wells were consistent with the past results with an increase at MW-307M3 to 0.91 ug/L. Mid-plume wells were consistent, with an increase at MW-368M2. The downgradient wells were consistent with an increase at MW-399. Downgradient wells had decreased or remained consistent with an increase at MW-399.

The J-2 East RDX conceptual model is consistent with the model used for system design; concentrations in the Western Lobe have decreased; there was no change in the max concentration; the highest concentrations are in the core of the plume; and concentrations at MW-399 continue to remain low.

The next steps for J-2 East include continuation of the annual IGMP sampling round; semiannual IGMP sampling round, system operation, and SPM hydraulic monitoring, and SPM chemical monitoring. The first SPM report will be issued nine months after startup.

A copy of this presentation was provided at the meeting and is a preview of the upcoming report on the J-2 North system which includes data from the J-2 East IGMP.

J-3 RRA 2007 SPEIM Update – Mike Goydas, Mike Morris

Annual Report Data Presentation

A copy of this presentation was provided at the meeting.

This presentation provides an overview of the information that will be presented in the annual report. It covers updates on chemical monitoring results; the J-3 plant; hydraulic analysis; ecological impact assessment; plume shell; plume fate and transport model; and the next steps.

Chemical Monitoring Activities: J-3 SPEIM sampling included one annual round of 61 wells conducted in September 2007 and one semiannual round of 29 wells conducted in March 2007. The wells were sampled for perchlorate and RDX.

Deviations include downgradient wells on the shoreline of Snake Pond could not be sampled in 2007 based on high water levels. These wells were sampled in spring 2008. SPEIM well MW0035 has been destroyed and no longer available for sampling. The well is located adjacent to 90EW002.

In the annual report, the J-3 plume was divided into four sections: the trailing edge located near the source area; the plume upgradient of the base boundary; the plume downgradient of the base boundary; and the leading edge locations.

J-3 RDX Results

The trailing edge has had consistent NDs in the monitoring wells; decreases over time in three monitoring wells, and a significant decrease in source area MW-163S. The plume core upgradient of the base boundary has seen decreases in eight monitoring wells; NDs in 16 monitoring wells; and increases in three monitoring wells. There are variable concentrations of RDX in MW-198; and an increase in MW-227M2. The portion downgradient of the plume shows a decrease in seven wells and ND in three wells, with slight increases (less than 0.1 ug/L) in concentration at wells 90MP59B and 90PZ211. The most downgradient well that could be sampled for RDX has been ND throughout its sampling history. Of the leading edge wells, 11 were underwater due to the high water level in Snake Pond and one leading edge well was ND.

The RDX results show the general footprint of the J-3 Range plume has not changed significantly from the RI/FS depiction; the maximum concentration of RDX in the 2007 plume is 37.6 ug/L; there was a significant decrease in RDX concentration in the trailing edge of the plume; the main body plume wells show decreasing concentrations on the eastern side and more fluctuating concentrations on the western flank; the shallower wells on the western side maybe decreasing faster than the deeper wells; the RDX concentration near J3EW1P1 show declining concentrations; concentrations increased in in-plume well MW-227M2 indicating an area of higher concentrations that was downgradient of the extraction well prior to startup; and concentrations of RDX decrease in proximity to downgradient extraction wells J3EW0032 and 90EW0001.

J-3 Perchlorate Results

Trailing edge wells showed decreases or no changes. There were consistent NDs in two monitoring wells; decreases at eight monitoring wells; an increase in one monitoring well. There was a decrease from 33.2 ug/L to 1.29 ug/L in source area well MW-163S. The plume core upgradient of the base boundary showed decreases in 16 monitoring wells; NDs in eight monitoring wells; increases at six monitoring wells. Plume core wells downgradient of base boundary show decreases in eight wells and consistent ND in four wells; slight increases in three wells. The most downgradient wells that could be sampled for perchlorate have been ND throughout its sampling history. Of the leading edge wells, 11 were underwater due to the high water level in Snake Pond; and four leading edge wells were ND.

The perchlorate results show the general footprint of the J-3 Range perchlorate plume has not changed significantly from the RI/FS depiction; the maximum concentration of perchlorate in the 2007 plume is down from the previous high in the 2004. There is significant decrease in perchlorate concentrations in the trailing edge of the plume. The main body plume wells show decreasing concentration on the eastern side and more fluctuating concentrations along the

center of the plume. Perchlorate concentrations near J3EW1PI show slightly increasing concentrations and decrease in proximity to downgradient extraction wells JH3EW0030 and 90EW0001 which is similar to what was seen in RDX.

J-3 plant performance; SPM hydraulic assessment; analytical capture zone assessment were also discussed. New perchlorate and RDX plume shells representing September 2007 conditions and including data from October 2002 to September 2007 were shown and discussed. Different concentration cutoff summaries for perchlorate and RDX were shown and compared to the previous plume shells.

RDX and Perchlorate animations were demonstrated, along with future predictions using the new plume shell and the new model. The animations will be included in the annual report.

The next steps for J-3 include increasing sampling frequency in MW-343M1; resurveying two well locations; maintaining the schedule for sampling and developing an annual report after the September 2008 event. The 2008 SPEIM report will evaluate the treatment system under optimized conditions and evaluate the need to optimize the J3EW1 well based on hydraulic and chemical monitoring at MW-343M1.

MMR IAGWSP Tech Meeting Minutes 05-29-2008

The following are notes from the 29 May 2008 Technical Team Meeting of the Impact Area Groundwater Study Program office at Camp Edwards. Please note that Action Items/Requests are highlighted in bold, italicized type.

Southeast Ranges Construction Update – Dave Hill

- **J-2 East Construction**
Drilling began at MW-4 (the well between Wood Road and the Coast Guard Access Road) and screening data is expected within two weeks. Completion of development of EW-5 (on Wood Road) is anticipated for this week. Installation of the infiltration pipe under Greenway Road along the Wood Road transect is being done this week. Installation of utility poles along Wood Road and the road out to EW-4 is ongoing.
- **J-1 North**
J-1 North and CIA groundwater sampling has been adversely impacted by exclusion zones associated with the Air Force Research Lab robotics technology demonstration. Work continues outside the exclusion zone for the next two weeks.

Robotics Update

Dave Hill presented the EM-61 map of the 150 Berm at the J-1 Range. The device was dragged from the up-range edge of the 150 berm to the top and back, there are a series of lanes, and divided into grids. The next step is to investigate the area in front of the berm that is below grade where it appears debris is buried.

Digging and brush-cutting continues on the 2,000 meter berm. IAGWSP is considering removing the berm.

Lynne Jennings (EPA) noted that EPA made a presentation at a recent Federal Facilities National Meeting on what is being done at MMR on robotics, and in particular the magnet. This

equipment was used at a site in Region 9 and one of the impacts of using the magnets was that it magnetized the soil and so the EM-61 was not effective. The IAGWSP is aware of that.

Tom Hall asked for clarification on the net explosives weight on consolidated shots; Jay Ehret (USACE) indicated the net explosive weight is 15 lbs. Mr. Hall also asked when the magnet pulls something that is suspect, does the magnet stop or continue. Ben Gregson will follow-up with this issue.

Mr. Ehret also noted there is no surface clearance before the machine is brought in to the area.

Ms. Jennings asked for the status and terms of reconciling the EPA comments on the Materials Handling Project Note. IAGWSP and EPA will review today if time permits.

Former B and D Field Delineation – Ben Gregson

Work will be completed next week. The final information and GIS data will be forthcoming when ready. The next step from IAGWSP's standpoint is to calculate methodology for removing the bullets from the range.

RCS – Ben Gregson

Demo 1 Supplemental Post Screening Report: IAGWSP feels if there is no sense of urgency, they would like to wait for the CRREL nitroglycerine DNT leaching work to finish before the document is completed.

UXO Scoping Meetings – There is still a number of UXO scoping meetings and source assessment work plans that are on the schedule and those continue to shift out as we work through L Range and J-3 Range in the UXO work group forum.

The J-3 presentation held at the last Tech Meeting laid out the history of the ranges and what the IAGWSP thinks the range boundaries are; and laid out the types of rounds that are expected to be found there based on the history. The first step in the process is to get an understanding of these ranges and get feedback from the regulatory agencies. EPA noted their concern is directed toward the technical next steps of the areas that are the most problematic.

The IAGWSP asked if the regulatory agencies are planning to comment on the near-term plume assessment presentations made by the IAGWSP for CIA and J-1 North.

- J-1 North: EPA is expecting an RI/FS report in early 2009; and if the report continues to get pushed out much beyond another year, it will become problematic for the EPA.
- CIA and J-1 North: EPA is expecting active alternatives on these two plumes. IAGWSP will provide a schedule for alternatives preview presentations, and is keeping the RRA option open.

EPA has the FS for Northwest Corner and will submit comments. IAGWSP is waiting for approval on the MOR for Western Boundary from EPA, DEP has approved the MOR. Demo 2 is on track and IAGWSP intends to submit the RI/FS next week.

Central Impact Area Technical Coordination Meeting #1 – Bill Gallagher

This is the first of a series of Technical Coordination Meetings proposed by the IAGWSP. IAGWSP is evaluating both short term and long term solutions (possibly RRAs) for the CIA and would like to work with the regulatory agencies to get consensus on plume interpretation, source conceptual model, and the path forward. These meetings will be shaped to meet the needs of the group.

Chris Abate (AMEC) reviewed some lessons learned from the Feasibility Study Screening Report (FSSR) and the UXO/Source Area Report. A copy of the presentation was handed out to the attendees.

Several figures and tables were displayed and discussed:

- Figure 4-1: Extent of RDX in Groundwater
- Figure 4-2: Cross Section A-A' RDX Distribution in Groundwater
- Figure 4-5: Cross Section D-D' RDX Distribution in Groundwater
- Figure 4-10: Cross Section I-I' RDX Distribution in Groundwater
- Figure 4-19: CIA RDX Recent Water Table Results
- Figure 4-19: Estimated RDX Source Areas
- Figure 4-29: Comparison of Predicted and Observed Shallow Groundwater Concentrations
- Table 4-3: Estimated RDX Source Areas

Lynne Jennings indicated that EPA is in agreement that shallow groundwater detections are a good indicator of current active source areas. However, EPA does not agree that reduction in plume volume is the most useful parameter for comparing alternative effectiveness. EPA agrees it can be used as one of the metrics for helping focus the feasibility study, moving toward the metrics that are traditional for EPA in selecting remedies, which is time to restoration.

In moving forward, it was proposed to define appropriate meeting topic priorities and schedule and adjust the content and pace to ensure the sessions are productive for all stakeholders. Some proposed meeting topics include plume interpretations, source area delineation, and UXO density. From EPA's perspective, it was suggested making the current active source discussion and evaluating alternatives to address the source area a high priority.

Schedule of Scoping Meetings:

Duration of Scoping – 4 months for feasibility study alternatives.

First agenda topic will be a detailed discussion of the source area.

IART Meeting for May 2008

There was a joint meeting of the Impact Area Review Team (IART) and the Plume Cleanup Team (PCT) meeting on 14 May 2008. The agenda included late breaking news and responses to action items, an Impact Area Groundwater Study Program Remediation and Investigation update, a presentation on the Robotics Technology Demonstration project, and update on Demo 1 System Performance, and Installation Restoration Program (IRP) updates on PFSA, FTA-2, LF-2 and CS-10. The IART and PCT are holding combined meetings to provide a forum for community input regarding issues related to both the Installation Restoration Program and the Impact Area Groundwater Study Program

3. SUMMARY OF DATA RECEIVED

Table 4 summarizes the detections, since 1997, that equaled or exceeded an EPA Maximum Contaminant Level (MCL), MassDEP MCL (MMCL) or Health Advisory (HA) for drinking water. Table 4 is updated on a monthly basis; discussions in the text are updated on the same schedule as Figures 1 through 8, which are discussed later in this section.

Table 5 summarizes the validated detections of explosives and perchlorate for all groundwater results received from 01 May through 30 May 2008. These results are compared to the MCL/HA values for respective analytes. First-time validated detections of Volatile Organic

Compounds (VOC), Semi-Volatile Organic Compounds (SVOC), metals, herbicides and pesticides are included and discussed quarterly in the March, June, September, and December Monthly Progress Reports. Metals, chloroform, and bis (2-ethylhexyl) phthalate (BEHP) are excluded from Table 5 for the following reasons: metals are a natural component of groundwater, particularly at levels below MCLs or HAs; detections of chloroform are pervasive throughout Cape Cod and are not likely the result of military training activities; and BEHP is believed to be largely an artifact of the investigation methods and may be introduced to the samples during collection or analysis.

Figures 1 through 8 depict the cumulative results of groundwater analyses for the period from the start of the Impact Area Groundwater Study (July 1997) to the present. There are no new groundwater data to report for metals, VOC, SVOC, pesticides or herbicides. Figures 1 and 8 have been updated and are included in this report. Each figure depicts results for a different analyte class:

- Figure 1 shows the results of explosive analyses by EPA Method 8330. This figure is updated and included each month.
- Figure 2 shows the results of inorganic analyses (collectively referred to as “metals”, though some analytes are not true metals) by methods E200.8, 300.0, 350.2M, 353M, 365.2, CYAN, IM40MB, IM40MBM, and IM40HG. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 3 shows the results of VOC analyses by methods OC21V, OC21VM, 504, 8021W, and SW8260 exclusive of chloroform detections. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 4 shows the chloroform results using the VOC analyses by method OC21V and OC21VM. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 5 shows the results of SVOC analyses by methods OC21B and SW8270, exclusive of detections of BEHP. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 6 shows the BEHP results using the SVOC analyses by methods OC21B and SW8270. This figure is updated and included semi-annually in the June and December Monthly Progress Reports.
- Figure 7 shows the results of Pesticide (method OL21P) and Herbicide (method 8151) analyses. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 8 shows the results of Perchlorate analysis by method E314.0. This figure is updated and included each month.

The concentrations from these analyses are depicted in Figures 1 through 8 compared to Maximum Contaminant Levels (MCLs) or Health Advisories (HAs) published by EPA for drinking water. The color coded legends are defined on each figure.

There are multiple labels listed for some wells in Figures 1 through 8, which indicate multiple well screens at different depths throughout the aquifer. The aquifer is approximately 200 to 300 feet thick in the study area. Well screens are positioned throughout this thickness based on various factors, including the results of groundwater profile samples, the geology, and projected locations of contaminants estimated by groundwater modeling. Generally, groundwater entering the top of the aquifer will move deeper into the aquifer as it moves radially outward from the top of the water table mound. Light blue dashed lines in Figures 1 through 8 depict water table contours. Groundwater generally moves perpendicular to these contours, starting at the center

of the 70-foot contour (the top of the mound) and moving radially outward. The rate of vertical groundwater flow deeper into the aquifer slows as groundwater moves away from the mound.

The results presented in Figures 1 through 8 are cumulative, which provides a historical perspective on the data rather than a depiction of current conditions. Any detection at a well that equals or exceeds the MCL/DWEL/HA results in the well having a red symbol, regardless of later detections at lower concentrations, or later non-detects. The difference between historical and current conditions is generally contributed to the effectiveness of remedial actions. Extraction, treatment, and recharge (ETR) systems are in operation at Demo1, J-1 South, J-2 North and J-3 Ranges to treat contaminated groundwater in order to control further migration of explosives and/or perchlorate.

Figure 1: Explosives in Groundwater Compared to MCLs/HAs

Changes in detection trends in groundwater samples collected during spring system performance and long term monitoring sampling events at respective study areas are discussed in biweekly data updates (*Summary of Explosives and Perchlorate Results*). The MCL/HA for RDX was exceeded in two groundwater samples collected from extraction wells within the Demo 1 study area. MW-431 (EW-501) and MW-432 (EW-502) were sampled during the Demo 1 May 2008 sampling event at the request of the USACE. This was the first time these wells were sampled for explosive compounds and the RDX results in both wells exceeded the MCL/HA of 2 ug/l.

Exceedances of drinking water criteria for explosive compounds have been indicated in seven general areas:

- Demo Area 1 (wells 19, 31, 34, 73, 76, 77, 114, 129, 139, 165, 210, and 211);
- Demo Area 2 (wells 16, 160, 259, 262, and 404);
- Former A Range (well 206);
- The Impact Area and CS-19 (wells 58MW0001, 58MW0002, 58MW0009E, 58MW0011D, 58MW0016B, 58MW0016C, 58MW0018B; and wells 1, 2, 23, 25, 37, 38, 40, 43, 85, 86, 87, 88, 89, 90, 91, 93, 95, 98, 99, 100, 101, 102, 105, 107, 111, 112, 113, 176, 178, 184, 201, 203, 204, 207, 209, 212, 223, 235, OW-1, OW-2, and OW-6);
- J Ranges and southeast of the J Ranges (wells 45, 58, 130, 132, 147, 153, 163, 164, 166, 171, 191, 193, 196, 198, 215, 218, 227, 232, 234, 247, 265, 289, 303, 306, 324, 326, 343, 360, 368, 369, 398, 477, 481, 485, 486, 487, and wells 90MW0022, 90MW0041, 90MW0054 and 90WT0013); and
- Northwest Corner of Base Boundary (well 323).

Exceedances of drinking water criteria were measured for TNT at Demo Area 1 (MW-19S, MW-31S, MW-31M, and MW-31D) and Southeast of the Ranges (MW-196S). Exceedances of the HA for RDX were noted at all of the locations listed above except at MW-45. An exceedance of drinking water criterion was measured for 2,6-dinitrotoluene (2,6-DNT) in one sample collected from MW-45S.

Demo Area 1 has a single well-defined source area and extent of contamination. As noted in Section 1 above, extraction, treatment, and recharge (ETR) systems at Frank Perkins Road and Pew Road in the Demo 1 study area include extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

Demo Area 2 has had groundwater exceedances of the RDX HA at MW-16S, MW-160S, MW-259, MW-262M1, and MW-404M2. The extent of the contamination is currently under investigation.

The Former A Range has had exceedances of the RDX HA at MW-206M1. The S screen in this location is non-detect for all explosives.

The Impact Area has a plume defined by RDX concentrations above the HA of 2 ppb. The plume originates primarily along Turpentine Road and extends downgradient to the west-northwest. Another source of RDX in the Impact Area is CS-19. Portions of CS-19 are currently under investigation by the Air Force Center for Environmental Excellence (AFCEE) under the Superfund program.

The J Ranges and downgradient areas have five groundwater plumes defined by concentrations of RDX above the HA of 2 ppb. The five plumes originate at the J-1 Range Interberm Area (northern plume in the vicinity of MW-58 and MW-265), the J-2 Range North plume (northern plume extending from MW-130), the J-2 Range East plume (eastern plume including MW-215), the J-3 Range Demolition Area (southern plume extending from MW-163 south to Snake Pond) and the L Range (in an area defined by MW-147 and MW-153 at Greenway Road). In addition, RDX detections at MW-398M2 suggest a possible plume at the south end of the J-1 Range. Extraction, treatment, and recharge (ETR) systems are currently in operation at J-1 South, J-2 North and J-3 Ranges to treat contaminated groundwater in order to control further migration of explosives and/or perchlorate.

The Northwest Corner of the base boundary has validated detections of RDX in groundwater above the HA of 2 ppb at MW-323M2. The M1 screen in this location has validated detections of RDX in groundwater below 2 ppb. The S screen at this location is non-detect for explosives.

Figure 2: Metals in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for metals are scattered throughout the study area. Where two or more rounds of sampling data are available, the exceedances generally have not been replicated in consecutive sampling rounds. The exceedances have been measured for antimony, arsenic, cadmium, chromium, lead, molybdenum, sodium, thallium and zinc. Exceedances of the arsenic drinking water criteria were repeated at three (wells 58MW0010A, MW-7M1 and MW-45S) of the six locations with arsenic exceedances. At the remaining three locations (wells MW-3D, MW-52M2 and MW-152M1), arsenic exceedances were not repeated in subsequent results. Cadmium (well MW-52M3) and chromium (well MW-7M1) were each detected above drinking water criteria in a single sampling round in August-September 1999. Exceedances of the drinking water criteria for lead were repeated at two of four locations (wells ASP and MW-45S). At the remaining two locations (wells MW-2S and MW-7M1) lead exceedances were not repeated in subsequent results. Exceedances of the drinking water criteria for molybdenum were repeated at two of eight locations (wells MW-53M1 and MW-54S) with molybdenum exceedances. All of the molybdenum exceedances were observed in year 1998 and 1999 results. Exceedances of the drinking water criteria for sodium were repeated at 12 of the 21 locations with sodium exceedances (wells MW-2S, MW-21S, MW-46S, MW-57M3, MW-57M2, MW-57M1, MW-144S, MW-145S, MW-148S, MW-187D, ASP and SDW261160). Seven wells (MW-21S, MW-57M1, MW-57M3, MW-187D, BHW215083B, BHW215083D and ASP) had sodium exceedances in year 2004, 2005, and/or 2006 results. Zinc exceeded the HA in seven wells, all of which are constructed of galvanized (zinc-coated) steel.

Groundwater samples sent for target analyte metals analysis are analyzed by Inductively Coupled Plasma (ICP) in accordance with EPA method SW846/6010 with the exception of thallium and antimony. Groundwater samples submitted for antimony and/or thallium analysis are analyzed by Inductively Coupled Plasma/Mass Spectroscopy (ICP/MS) in accordance with the EPA Method SW846/6020. The ICP/MS Method 6020 has greater sensitivity, lower detection limits and the added feature of selectivity for antimony and thallium.

There have been few exceedances of drinking water limits for antimony and thallium since the introduction of more sensitive methods. Antimony levels exceeding drinking water criteria were detected in samples from 13 locations; these levels were not detected in subsequent sampling rounds. Only two antimony exceedances (wells MW-38M2 and MW-73S) were measured since January 2003. Twelve of the 71 locations with thallium exceedances had repeated exceedances in subsequent sampling rounds (wells MW-7M1, MW-7M2, MW-19S, MW-45S, MW-47M2, MW-47M3, MW-52S, MW-52D, MW-54S, MW-54M1, MW-58S and MW-94M2). There have been no exceedances of thallium since January 2003.

The distribution and lack of repeatability of the metals exceedances is not consistent with a contaminant source, nor do the detections appear to be correlated with the presence of explosives or other organic compounds. The IAGWSP evaluated inorganic background concentrations using the groundwater quality database of 1999, and submitted a draft report describing background groundwater quality in December 1999.

Figure 3: VOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for VOCs are indicated in six general areas: Northeast Corner (well LRMW003), Impact Area boundary (MW-28S), CS-10 (wells 03MW0007A, 03MW0014A, and 03MW0020), FS-12 (wells MW-45S, 90MW0003, and ECMWSNP02D), and in the J-1 Range (well MW-187D). CS-10, LF-1 and FS-12 are sites located near the southern extent of the Training Ranges that are currently under investigation by AFCEE under the Superfund program. Exceedances of drinking water criteria were measured for tetrachloroethylene (PCE) at CS-10, for vinyl chloride at LF-1, and for methylene chloride, toluene, 1,2-dichloroethane, and ethylene dibromide (EDB) at FS-12. These compounds are believed to be associated with the sites under investigation by AFCEE; these sites currently have active treatment systems in place. Detections of benzene, tert-butyl methyl ether, and chloromethane at J-1 Range well MW-187D, chloromethane at Northeast Corner well LRMW003, and 1,2-dibromo-3-chloropropane at Impact Area boundary well MW-28S are currently under investigation.

Figure 4: Chloroform in Groundwater Compared to MCLs

Chloroform has been widely detected in groundwater across the Upper Cape as stated in a joint press release from USEPA, MassDEP, IRP, and the Joint Programs Office. The Cape Cod Commission (2001) in their review of public water supply wells for 1999 found greater than 75% contained chloroform with an average concentration of 4.7 ug/L. The IRP has concluded chloroform is not the result of Air Force activities. A detailed discussion of the presence of chloroform is provided in the Final Central Impact Area Groundwater Report (06/01).

Figure 5: SVOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for SVOCs are scattered throughout the study area. All exceedances of drinking water criteria for SVOCs were measured for bis (2-ethylhexyl)

phthalate (BEHP), with the exception of two wells. MW-264M1 (J-3 Range) had a detection of benzo(a)pyrene at concentrations of more than twice the HA and MW-241M1 (L Range) had detections of naphthalene above the HA of 100 ppb. Detections of BEHP are presented separately in Figure 6 and discussed in the next paragraph.

Figure 6: BEHP in Groundwater Compared to MCLs

Exceedances of drinking water criteria for bis (2-ethylhexyl) phthalate (BEHP) are scattered throughout the study area. BEHP is believed to be largely an artifact of the investigation methods and may be introduced to the samples during collection or analysis. However, the potential that some of the detections of BEHP are the result of activities conducted at MMR has not been ruled out.

A detailed discussion of the presence of BEHP is provided in the Draft Completion of Work Report (7/98) and subsequent responses to comments. The theory that BEHP mostly occurs as an artifact, and is not really present in the aquifer, is supported by the results of subsequent sampling rounds that show much lower levels of the chemical after additional precautions were taken to prevent cross-contamination during sample collection and analysis. Only four locations (out of 93) showed BEHP exceedances in consecutive sampling rounds: 28MW0106 (located near SD-5, a site under investigation by AFCEE), 58MW0006E (located at CS-19), 90WT0013 (located at FS-12), and MW-146M1 (located at L Range). Subsequent sampling rounds at all these locations have had results below the MCL. Eleven wells (27MW0705, 27MW2061, C2-B, C6-C, C7-B, MW-47M2, MW-164M1, MW-168M1, MW-188M1, MW-196M1, and MW-198M1) had BEHP exceedances in the year 2002 and 2003 results. There have been no exceedances of BEHP in 2004, one exceedance of BEHP, at MW-356M1 (J-3 Range), in 2005, and one exceedance of BEHP, at MW-477M2 (J-1 Range), in 2007.

Figure 7: Herbicides and Pesticides in Groundwater Compared to MCLs/HAs

There has been one exceedance of drinking water criteria for pesticides, at well PPAWSMW-1. A contractor to the United States Air Force installed this monitoring well at the PAVE PAWS radar station in accordance with the Massachusetts Contingency Plan (MCP), in order to evaluate contamination from a fuel spill. The exceedance was for the pesticide dieldrin in a sample collected in June 1999. This well was sampled again in November 1999. The results of the November sample indicate no detectable pesticides although hydrocarbon interference was noted. It appears from the November sample that pesticides identified in the June sample were false positives.

There has been one exceedance of drinking water criteria for herbicides, at well MW-41M1 (Impact Area). This response well was installed downgradient of the Impact Area. The exceedance was for the herbicide pentachlorophenol in a sample collected in May 2000. There were no detections above the MCL of this compound in the three previous sampling rounds in 1999, nor in the subsequent sampling rounds in 2000, 2001, 2002, and 2003.

Figure 8: Perchlorate in Groundwater Compared to a 2 ppb Concentration

Changes in detection trends in groundwater samples collected during spring system performance and long term monitoring sampling events at respective study areas are discussed in biweekly data updates (*Summary of Explosives and Perchlorate Results*). Extraction wells MW-431 (EW-501) and MW-432 (EW-502) were sampled during the Demo 1 May 2008 sampling event at the request of the USACE. This was the first time these wells were sampled

for perchlorate. The reported perchlorate concentration for the samples collected from MW-432 exceeded 2 ug/l, the result for perchlorate in MW-431 was less than 2 ug/l.

Sampling and analysis of groundwater for perchlorate was initiated at the end of the year 2000 as part of the IAGWSP. Cumulative exceedances of the 2 ppb concentration of perchlorate have been indicated in seven general areas:

- Demo Area 1 (wells 19, 31, 32, 33, 34, 35, 36, 73, 75, 76, 77, 78, 114, 129, 139, 162, 165, 172, 210, 211, 225, 255, 258 and 341);
- Impact Area and CS-19 (wells 58MW0009C, 58MW0015; and wells 38, 89, 91, 93, 101, and OW-1);
- J Ranges and southeast of the J Ranges (wells 93, 125, 127, 128, 130, 132, 142, 143, 158, 163, 166, 193, 197, 198, 215, 232, 234, 237, 243, 247, 250, 263, 265, 286, 289, 293, 295, 300, 302, 303, 305, 307, 310, 313, 319, 321, 324, 326, 329, 335, 339, 343, 346, 348, 366, 368, 370, 393, and wells 90PZ0211, 90MW0022 and 90MW0054, 90WT0013, J2EW3-MW-2-B, and RS003P);
- Northwest Corner of Base Boundary (wells 4036009DC, 66, 270, 277, 278, 279, 283, 284, 287, 297, 301, 309, 323, and RSN0W3); and
- Western Boundary (wells 80, 233, and 267).

Demo Area 1 has a single well-defined source area and extent of contamination. As noted in Section 1 above; extraction, treatment, and recharge (ETR) systems at Frank Perkins Road and Pew Road in the Demo 1 study area include extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Impact Area has had eight locations with exceedances of the 2 ppb concentration of perchlorate. The perchlorate plume extends from near the center of the Impact Area to the northwest, in the vicinity of Burgoyne Road.

Plumes have been identified in four areas in the J Ranges. The J-1 Interberm perchlorate plume has had several perchlorate detections in downgradient locations MW-265, MW-286, MW-303, MW-326, MW-346, and MW-370. The J-3 Range Demolition perchlorate plume has detections in several wells immediately downgradient of the source area, which is centered at MW-198, and further downgradient centered near location 90MW0054. The J-2 Range North perchlorate plume has detections at source area locations MW-130 and MW-263, and downgradient locations MW-289, MW-293, MW-300, MW-302, MW-305, and MW-313. The J-2 East perchlorate plumes are in the process of delineation and include detections at MW-307, MW-310 and MW-368. There was a single perchlorate detection in a sample collected in September 2003 from well 90WT0013 at the L Range which exceeded 2 ppb. Extraction, treatment, and recharge (ETR) systems are currently in operation at J-2 North and J-3 Ranges to treat contaminated groundwater in order to control further migration of explosives and/or perchlorate.

The Northwest Corner has a perchlorate plume extending from Canal View Road at the base boundary to the Cape Cod Canal. This area is under investigation and the plume will be updated and refined as new data is received.

The Western Boundary has had three locations (MW-80M1, MW-233M3, and MW-267M1) which have exceeded the 2 ppb perchlorate MMCL in one or more sampling rounds. Only MW-

233M3 has perchlorate detected above the 2ppb MMCL in the most recent sampling round (3/28/08). The perchlorate results for other Western Boundary wells are all below the MMCL.

4. DELIVERABLES SUBMITTED

Deliverables submitted during the reporting period include the following:

Final L Range Groundwater Human Health Risk Assessment	05/08/2008
J-1 Range South Groundwater RRA Completion of Work Report	05/08/2008
Monthly Progress Report No. 133 for April 2008	05/10/2008

5. SCHEDULED ACTIONS

Figure 9 provides a Gantt chart updated as of 02 February 2008, to reflect progress and proposed work.

The following documents are being prepared or revised during June:

- J-1 Range South Soil/Groundwater Final Remedial Investigation/Feasibility Study Report
- J-2 Range Groundwater Interim Remedial Investigation/Feasibility Study Report
- J-3 Range Groundwater Interim Remedial Investigation/Feasibility Study Report
- L Range South Soil/Groundwater Draft Remedial Investigation/Feasibility Study Report
- Draft Gun Position 2 (GP-2) Soil and Groundwater Investigation Report
