

**MONTHLY PROGRESS REPORT #139
FOR OCTOBER 2008**

EPA REGION I ADMINISTRATIVE ORDERS SDWA 1-97-1019 and 1-2000-0014

**MASSACHUSETTS MILITARY RESERVATION
TRAINING RANGE AND IMPACT AREA**

The following summary of progress is for the period from 01 October to 31 October 2008.

1. SUMMARY OF REMEDIATION ACTIONS

The following is a description of Remediation Actions (RA) underway at Camp Edwards as of October 2008. Remediation actions may include Rapid Response Actions (RRA). An RRA is an interim action that may be conducted prior to risk assessments or remedial investigations to address a known, ongoing threat of contamination to groundwater and/or soil.

Demo Area 1 Comprehensive Groundwater RA

The Demo Area 1 Comprehensive Groundwater RA consists of the removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. Extraction, treatment, and recharge (ETR) systems at Frank Perkins Road and Pew Road include extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Pew Road ETR continues operation at a flow rate of 103 gallons per minute (gpm). As of 31 October 2008 over 68 million gallons of water were treated and reinjected at the Pew Road System.

The Frank Perkins Road ETR continues to operate at a flow rate of 808 gpm. As of 31 October 2008, over 463 million gallons of water have been treated and re-injected at the Frank Perkins Road Treatment System. Re却jection well IW-D1-1 associated with the Frank Perkins Road Treatment Facility was shut off on 27 October 2008. The system is running at a reduced rate while sand from the well is being evacuated; work is expected to be completed on 4 November 2008.

J-1 Range South Groundwater RRA

The J-1 Range South Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives. The ETR system includes a single extraction well, ex-situ treatment process to remove explosives from the groundwater, and an infiltration trench to return treated water to the aquifer.

The J-1 Range South system continues to operate at a flow rate of 75 gpm. As of 31 October 2008, over 40 million gallons of water were treated and re-injected.

J-2 Range North Groundwater RRA

The J-2 Range North Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and infiltration basins to return treated water to the aquifer.

The J-2 Range North treatment plant continues to operate at 125 gpm. As of 31 October 2008, over 142 million gallons of water treated and re-injected.

The J-2 Range North Mobile Treatment Units (MTU) E & F continue to operate at a flow rate of 250 gpm. As of 31 October 2008, over 275 million gallons of water were treated and re-injected. J-2 North MTUs are running at a reduced rate while the Wood Road Infiltration Gallery is being modified. Work is expected to be completed on 4 November 2008.

J-3 Range Groundwater RRA

The J-3 Range Groundwater RRA consists of removal and treatment of contaminated groundwater to control further migration of explosives and perchlorate. ETR systems include single extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater and use of the existing Fuel Spill-12 (FS-12) infiltration gallery to return treated water to the aquifer.

The J-3 Range system continues to operate at a flow rate of 195 gpm. As of 31 October 2008, over 195 million gallons of water were treated and re-injected.

J-2 Range East Groundwater RRA

The J-2 Range East Groundwater RRA consists of removal and treatment of groundwater to minimize down gradient migration of explosives and perchlorate. The J-2 Range East Extraction, Treatment and Injection (ETI) system includes the following components: three extraction wells in an axial array, an ex-situ treatment process consisting of an IX resin and GAC media to treat perchlorate and explosives and three infiltration trenches located along the lateral boundaries of the plume where treated water will enter the vadose zone and infiltrate into the aquifer. J-2 Range East system start up continued through the month of October and as of 11 October 2008, is up and running at a combined total flow rate of 425 gpm.

The J-2 East MTUs H and I (treating water from EW 5) continue to operate at a flow rate of 210 gpm. As of 31 October 2008, over 15 million gallons of water were treated and re-injected

The J-2 East MTU K (treating water from EW 4) continues to operate at a flow rate of 90 gpm. As of 31 October 2008, over 6.5 million gallons of water were treated and re-injected.

The J-2 East MTU J (treating water from EW 6) continues to operate at a flow rate of 125 gpm. As of 31 October 2008, over 9 million gallons of water were treated and re-injected.

2. SUMMARY OF ACTIONS TAKEN

Samples collected during the reporting period are summarized in Table 2.

Process water samples were collected at Frank Perkins Road, Pew Road, J-2 Range North, J-3 Range, J-1 Range South and J-2 Range East treatment plants.

The Fall 2008 system performance monitoring was completed for the J-2 Range North study area. Fall Long Term Monitoring samples were collected in the J-1 Range south, Demo 2 and Western Boundary study areas. Surface water samples were collected from Snake Pond.

Groundwater samples were collected from four drive point (DP) locations in the J-2 Extension South study area and two locations in the J-1 South study area.

Multi Incremental soil samples and lysimeter samples were collected from the Tango Range study area.

MMR IAGWSP Tech Meeting Minutes 09-25-2008

The following are notes from the 25 September 2008 Technical Team Meeting of the Impact Area Groundwater Study Program office at Camp Edwards:

SE Ranges Update

J-1 Range South Drive Point Data – Dave Hill

Drive points were added on Lichen Lane, at a location between MW-400 and MW-402 on Little Acorn, and another on Grand Oak. Two locations on the access road to the J-1 extraction well were staked out. IAGWSP anticipates completion of the well on Grand Oak and one well on the access road before the rig returns to AFCEE on October 1. The six-month report will be available for review by the end of next week. Another monitoring round will begin in October.

J-2 East System Start-Up – Dave Hill

Full scale pumping started on September 11 and has been operating at design rate since. There was a power outage this week; wells 4 and 6 are back on line; well 5 on Wood Road is experiencing some difficulties with the variable frequency drive.

Status of sampling MW-367 – The property owner requested the well be sampled under a one year lease to be renewed yearly. USACE agreed and is waiting for paperwork from the property owner's attorney.

Turbine Update – Hap Gonser (IAGWSP) reported out that everything is on hold waiting for outcome on legislation regarding authorizing issues and funding constraints.

J-3 SPEIM Annual Report – EPA's review of the annual report shows some difference in the clean up time for RDX. The in-plume well increased from 60 to 100. EPA requested IAGWSP give a presentation of the system. ***Dave Hill will review and reply to EPA.***

J-1 North – EPA requested a status of the FS Scoping Session. IAGWSP is designing an RA and anticipates feedback will be available in two weeks. ***J-1 North Alternatives will be discussed at the October 16 tech meeting.***

Robotics Update – Bill Gallagher

Handout: AFRL Demonstration Preliminary Finds to Date List (as of 9/20/08)

L Range – UXO clearance using the ARTS equipped with Cherrington attachment is complete. UXO teams continue to inspect the overs and there is a possibility that more rounds will be discovered.

J-1 Berm – IAGWSP inventoried items discovered at the J-1 Berms and what is listed in the handout represents all potential UXO. These UXO will be detonated at the consolidated shot location.

Central Impact Area – Anticipate completion of cutting of vegetation in approximately one month. The post-magnet EM-61 data are currently being evaluated to determine how to filter out background noise and provide more meaningful data. Two experiments being proposed are:

- choosing a plot of land to run a magnet over to determine if sub-surface soil and rocks are actually being magnetized
- burying inert ordnance rounds to different depths to determine if the magnets can pull them out from those depths.

Next step for the robotics demonstration will be discussed at the UXO Working Group meeting.

EPA requested clarification on the 3 inch “unknown” rocket. The model is unknown at present; ***USACE will resolve and forward that information to the regulatory agencies.***

Northwest Corner – Process Discussion

EPA was unable to locate some documents that were referenced in the Draft RI. These documents will be needed for the Decision Document, and should be resolved before moving forward with the FS.

IAGWSP suggested having an RI/FS document that contains the facts that have been agreed to by all parties. EPA feels it would be worthwhile to review the report, page-by-page, finalizing it to the extent it can be referenced in the FS and then moving forward. MassDEP agreed, noting there is value to having all parties meet to review and finalize, eliminating the ten day review and formal response to comments.

EPA noted that if there is going to be completion of a Decision Document for Northwest Corner next year, the RCS should show as a milestone a working meeting to prepare the document to use as a basis to support the FS.

CIA Plume Shell Punch List– Bill Gallagher

Handout: Plume Delineation Issues

IAGWSP, USACE, EPA and MassDEP met two weeks ago and reviewed the CIA plume depictions and cross-sections. The IAGWSP provided a handout summarizing agency comments titled Plume Delineation Issues. Each of the agencies 27 comments was discussed:

1. How the sliver of RDX at the northwest corner of the site will be handled, must still be finalized.

Final Disposition – Resolved: to be handled as part of the NWC Investigation Report/Feasibility Study.

2. The agencies noted that the screens at MW-149 are not optimally placed to delineate the end of the plume. There is still a chance that the plume could extend above the screens and stay north of MW-42.

Action: Figure 4-1, “Extent of RDX in Groundwater”, has been revised to extend the plume approximately 1,000 feet downgradient in the vicinity of Avery Road.

Final Disposition – Resolved

3. The agencies noted that there is no monitoring well beyond MW-102 to completely delineate the extent of the small plume passing through that area. After discussion, the agencies

accepted the current interpretation, but requested a double-check of the data to ensure things appear correct.

Action: MW-102S and MW-102M1 have been ND for RDX since their initial sampling in 2000. MW-102M2 was ND for RDX from June 2000 to August 2005. RDX was subsequently detected at 0.29Jppb (12/05), ND (4/06), and 3.8ppb (10/06). This last result was used for development of the plume shape. However, results for RDX have been ND during three subsequent rounds (5/07, 10/07 and 6/08). Fate & transport modeling predicts the rapid dispersion of small plumelets detached from their sources. Therefore, it appears that the plume representation on Figure 4-1 is reasonable.

Final Disposition – Resolved

4. With past detections at MW-108, the agencies inquired why there was no down gradient component to the plume.

Action: The small shallow plumelet interpreted to have passed through MW-108M4 exhibited a maximum historical concentration of 1.8 ppb on 5/02 and has declined steadily to 0.41J ppb in the most recent sample (12/05). Based on the relatively dilute concentrations and limited lateral extent of this plumelet, it is interpreted to have attenuated to below the plotting threshold of 0.6 ppb. In addition, fate & transport modeling predicts the rapid dispersion of small plumelets detached from their sources and is therefore consistent with this interpretation.

Final Disposition – Resolved

5. The label for 58MW0007B does not show on the figure. There is also no screen located below 7B, which appears in the middle of the estimated plume. The agencies note that without deeper data points, it is impossible to determine the true vertical extent of the plume. It was agreed that this data gap does not substantially effect evaluation of FS alternatives, but is noted for additional consideration during any potential design component of a treatment system

Action: The label for 58MW0007B has been added to Figure 4-1.

Final Disposition – Resolved

6. EPA requested that the separate 2-20 ppb contours on the cross-section be connected. IAGWSP indicated that the plumes are in fact connected, but the southeastern component represented in the section moves outside the view of this particular slice (section). It was agreed that a note would be added to indicate that the two components depicted on cross-section A-A' are connected, but that some of it moves north of 58MW0006E, taking it out of the view of cross section A-A'. (There is further discussion and decision on similar elements in later bullets)

Action: See language proposed in response to Issue 14.

Final Disposition – Resolved

7. MW-183 should be added to cross-section A-A' to bound the northwestern edge of the plume.

Action: Both cross-section A-A' and Figure 4-1 have been revised to include MW-183 on cross-section A-A'. As illustrated on the revised cross-section A-A', MW-183 does bound the northwest margin of the plume.

Final Disposition – Resolved

8. Agencies request an additional look at the data for the 95-series wells located at the northwest part of the site, along with a review of screen depths to see if they are at the right depth to intercept the plume upgradient.

Action: Explosives data was found for 95-6A, -6B, and -6ES. The following table provides a summary of each well:

Well	Screen Depth (ft below water table)	Sample Dates	No. of Sample Rounds	Results
95-6A	142.5 – 152.5	11/99 – 11/05	15	ND for exp.
95-6B	94 – 104	10/97 – 11/05	17	ND for exp.
95-6ES	0 – 10	11/99 – 9/05	6	ND for exp.

No results were found for wells 95-6F, -6TW, -6D, and -7.

Final Disposition – Pending particle track to determine if screen depths are properly located to intercept plume.

9. AMEC will run particle tracks from MW-88 to MW-123, and MW-89 to MW-124, to verify appropriate screen depths.

Action: The referenced particle tracks are shown on Figure 4-1PT.

MW-88: The particle track from MW-88M2 intersects MW-209M2 (-53' NGVD), and MW-123 at -68.5' NGVD.

MW-89: Particle tracks were run forward from MW-89M1 and -89M2. The PTs from MW-89M1 and -89M2 pass through MW-124 at -77.5' and -64' NGVD, respectively. These two depths are approximately 10-20 feet below MW-124M1, the deepest screen at MW-124.

Final Disposition – Resolved

10. The agencies requested that all AFCEE data be included in the bi-weekly distribution of MMR data. IAGWSP indicated that the bi-weekly distribution is a routine update of that data which is present in our database, and that AFCEE data is not a part of this. The agencies have more clear access to AFCEE data than do the IAGWSP through other channels, and it should not be included as part of the routine distribution.

Final Disposition – Resolved

11. The agencies requested clarification on the designations that read XXXXXX-A or XXXXXX-D. It is assumed that 'D' denotes duplicate sample, but this is not certain. IAGWSP to see if they can determine what these designations stand for.

Action: When used in a sample ID, the "A" typically represents the field sample and "D" represents a duplicate sample.

Final Disposition – Resolved

12. The agencies requested that the larger plume present in cross-section B-B', be connected to the smaller plume located down gradient. When viewed in concert with the plan view depiction of the plume, it is clear that the larger plume migrates north of MW-39, taking it out of the view of this particular cross-section.

Action: Although the plume depiction will not be changed, a note will be added to all cross-sections consistent with that proposed at Issue 14.

Final Disposition – Resolved

13. The agencies requested that the >20 ppb contour passing through MW-1 on cross-section B-B', be connected to the >20 ppb contour emanating from the ground surface at MW-1. This change will be made to the plume shell interpretations.

Action: The requested change has been made to cross-section B-B'.

Final Disposition – Resolved

- 14 The agencies requested that a note be added to all maps indicating that all cross sections and plan view depictions must be taken in the context of each other, and can not be properly interpreted by looking at any individual map.

Action: IAGWSP proposes to add the following language to all cross-sections and plan view depictions of plumes:

"All cross sections and plan view plume depictions must be taken in the context of each other, and can not be properly interpreted by looking at any individual depiction."

Final Disposition – Resolved

15. There was a question why the plume shown on cross-section C-C' trends vertically downward once past MW-209. The particle tracks agreed to above should help validate/invalidate this assumption.

Action: The orientation of the plume at and immediately downgradient of MW-209 is consistent with the inclination of the particle track from MW-88M2. Please see Issue 9 Action.

Final Disposition – Resolved

16. The agencies requested that the southeastern-most component of the plume depicted on cross-section C-C' should be extended back to the water table (source area). The plume was drawn (interpreted) as depicted due to the interpolation between NDs found at the water table at both DP-427 and DP-413. Given this data, it was assumed the source was no longer present at the water table, as shown in the figure.

Final Disposition – Resolved

17. In cross-section D-D', it is felt that the >20 ppb component of the plume is not sufficiently delineated. Given the duration of detections >20 ppb and the assumed rate of groundwater movement over that time, the interpretation should extend approximately an additional 1000-ft down gradient. This change will be made to the plume shell interpretation.

Action: Detections greater than 20 ppb have persisted since 4/04 at MW-235M1. Using the 1 foot per day rule (which may be too fast for deep groundwater near the top of mound) would put the leading edge approximately 1100' downgradient of MW-235 (or just beyond MW-101) in this depiction representing 3/07 conditions. The depiction has been redrawn on both the cross-section and plan view figures.

Final Disposition – Resolved

18. DP-405 should read MW-441 on cross-section E-E'.

Action: the requested change was made to cross-section E-E'.

Final Disposition – Resolved

19. There was some question as to why the eastern-most plumes were not connected. Given the uncertainties still surrounding the evaluation of this area, no connection should be made between the plume passing through MW-249, and that passing through DP-375. Once items surrounding handling by CIA vs. NWC are resolved, this can be revisited. In addition, the agencies inquired why there was an additional disconnect between that passing through DP-375 and that part of the plume starting just west of BH-363. It was explained that the plumes are likely connected, though by a part of the plume with detections <0.6 ppb, which is not shown on any of these drawings.

Final Disposition – Resolved

20. The agencies questioned the 'perfect circle' located on cross-section G-G' at MW-99. AMEC will investigate with its team and report to the group.

Action: The "perfect circle" is a relic interpretation from the longitudinal cross-section that used to pass through this well. Concentrations of RDX in MW-99M1 decreased consistently from 2.4 ppb (6/03) to 0.41 ppb (12/05; the most recent sample). Because RDX was less than 0.6 ppb in the last two rounds of samples, the "perfect circle" could be removed from cross-section G-G', and the plume boundary shifted slightly south on the plan view (Figure 4-1).

Final Disposition – Resolved

21. On cross-section F-F', there was a question as to why the plume does not extend further beyond MW-487. It was explained that this well is quite recent, and that the detections used during the preparation of this report should not be expected to have moved very far beyond this point. There were also questions as to why the plume passing through MW-112 and MW-113 did not connect to the plume passing through MW-204. It was explained that these two plumes could be connected, but likely at levels <0.6 ppb, which is not depicted as part of this report.

Final Disposition – Resolved

22. On several cross-sections, the boxes denoting well screens are colored white. This designation indicates screens with detections <0.6 ppb, similar to the green, and brown shadings of other well screen boxes when they have various detection levels.

Action: the legend on the cross-sections has been updated to include the white well screens.

Final Disposition – Resolved

23. The agencies requested a note on the figures to indicate that all white areas are not necessarily "clean". There may be contamination <0.6 ppb in these areas, that is not depicted on these maps. The IAGWSP believes it is clear that areas currently without coloration could still contain contamination <0.6 ppb, and does not believe a note is necessary.

Final Disposition – Resolved

24. The agencies had previously requested a table of all data used to develop the plume shells. IAGWSP to provide this data table to the team.

Final Disposition – Resolved

25. EPA requested information on the error bars (standard deviation) for RDX detections.

Action: For GW, the QAPP acceptance limit for precision for RDX (or all explosives) is 30% RPD for field duplicates. The detections at low levels down to the RL of 0.25 ug/l for explosives would also have the same 30% RPD for field duplicates. Field duplicates are collected at a 5% or 20:1 frequency for the MMR LTM Program. Typically, GW precision on field duplicates at MMR is almost always below 30% RPD and usually very close or exact. We do not consider there is much field sampling error for water samples.

Final Disposition – Resolved

26. The EPA expressed concern as to how we can ensure perchlorate maps are correct when no well have been profiled specifically for perchlorate. The perchlorate plumes are largely contained within the estimated RDX plumes, and are developed based on the data that is available. Since these perchlorate plumes are estimated to occur within the bounds of the

RDX plume, the IAGWSP does not believe any uncertainty associated with the depiction of these plumes will impact the evaluation of FS alternatives.

Final Disposition – Resolved pending submission of all perchlorate profiles performed within the CIA well network.

27. The agencies have requested that cross-section F-F' be extended to include MW-442.
Action: Cross-section F-F' has been revised to show MW-442 in its proper orientation/elevation. In addition, the plume plan view (i.e., Figure 4-1) has been revised to show cross-section terminating at MW-442.

Final Disposition – Resolved

28. The legend on all figures will have a definition added for the dashed line that surround all plume boundaries, indicating uncertainty.

Final Disposition – Resolved

All agreed there are three IAGWSP remaining action items from this discussion:

1. *Particle Track discussed in Comment #8.*
2. *Add dashed lines to Legend to indicate the uncertainty that surrounds this plume depiction.*
3. *Provide a list of wells and well screens that were sampled for perchlorate (Comment #26).*

The Source Area Delineation portion of this meeting has been postponed until Thursday, October 2 at 10:00. EPA and MassDEP indicated there are no major concerns.

MMR IAGWSP Tech Meeting Minutes 10-16-2008

The following are notes from the 16 October 2008 Technical Team Meeting of the Impact Area Groundwater Study Program office at Camp Edwards:

SE Ranges Update

J-1 Range South Update – Dave Hill

There are three new drive point wells proposed in the Grand Oak neighborhood to determine the nature and extent of the southerly component to the J-1 South plume. IAGWSP'S next step, once the drive points are completed, will be to install permanent monitoring wells at a subset of the drive point locations and determine whether to recommend additional remedial action for this plume. The drive point rig will be unavailable the week of October 27 but will return the first week in November.

IAGWSP will provide a map showing the concentrations of each well and drive point.

Robotics Update – Bill Gallagher

- Central Impact Area – Anticipate vegetation clearance will be complete by mid next week.
- Former K Range – Anticipate completion of cutting the additional fire breaks by the end of this week and the UXO crews continuing inspection of the areas that were exposed by the prescribed fire at or near the ground surface.
- J-1 Range – The consolidated shot was completed yesterday. Items destroyed included two 155 mm HE projectiles; two 81 mm live illumination mortars; two 81 mm HE mortars; and two live fuses. All the rest were inert rounds including the rocket in question. The

consolidated shot area is covered with poly. Sampling will begin next week. **IAGWSP, USACE, EPA and DEP will visit the site to delineate the area for sampling.**

- J-3 Range – Cutting the fire break at J-3 range will begin when cutting in Former K Range is complete. Anticipate cutting to square grids in the south central part of the range using the robotics.

Program Priorities and Milestones – Lynne Jennings

EPA requested a discussion on priorities and goals for the remainder of 2008, 2009, and 2010.

From EPA's perspective:

- Decisions regarding the implementation of groundwater remedies at CIA and J-1 North are EPA's highest priorities in terms of decision making. Regarding J-1, a decision of whether it is an RRA or final remedy in place and the documents should be complete by next year.
- A Decision Document (DD) is required where waste is left behind and land use controls put in place.
- BA-4 is the only OU not requiring a DD as waste will not be left behind.
- Push out the UXO decisions one more year to allow the working group and robotics work to play out.
- In terms of tackling the concept of soil/groundwater DD absent UXO: J-1 groundwater decision should be a high priority – adding language in the DD that addresses UXO by stating there is ongoing work to evaluate this issue and decisions will be made later as what to do with UXO. That DD can then be used later for J-2 and J-3.

EPA assignments for 2009

- Bob Lim – DD for Demo 1; complete BA-4; DD on Demo 2
- Carol Keating – DD for Northwest Corner and Western Boundary
- Jane Dolan – J-1 to the point of DD absent UXO and L Range
- Desiree Moyer – Moving CIA to FS completion and perhaps DD or RRA decision

For each 2009 priority, EPA's suggested next step is to establish the main deliverables, identify the status of the deliverables and the next step. Preparation of a compressed schedule for 2009 priorities and a rolled up schedule for everything over 12 months will be reviewed at each tech meeting.

Hap Gonser (IAGWSP) noted IAGWSP's suggested approach is to assign a "Closure Manager" who will be held accountable for assuring the site comes to closure. The Closure Manager will interact with the IAGWSP, EPA, and MassDEP project managers, the attorneys, CI, and others who have a claim. The schedule would be rolled up to a higher level for periodic review.

The next step will be to review the 2009 priorities and status, determine what needs to be done to complete the current deliverables, and a review of the schedule at the November 13 tech meeting. It was agreed that the priority list suggested by EPA will be used.

J-1 North Alternatives

Mr. Gonser's introduction noted that CIA and J-1 North are the last two plumes that don't have a system in place. J-1 North is in the Impact Area, where there is no exposure and there are land use constraints. Traditional active remedy will be high cost with little value and ecological damage along the way. Natural attenuation and LTM that is low cost is the other extreme. The task was to review alternative(s) (RRA or Final FS) that would give decision makers something that would achieve measurable gains at a reasonable cost, to develop a response action that

would keep the plumes within the impact area and attenuate by the end of the lease (2051). The goal for RDX was 0.6, 2 and 6 g/L; the goal for perchlorate was 2 g/L.

Katherine Thomas (JE) presented the updated J-1 North RDX and perchlorate 3-D plume shells which represents May 2008 conditions and includes data from mid-2002 to May 2008, and data collected from mid-2002 to late 2007 that was migrated to their probable May 2008 locations using the J-1 North 2007 model.

Based on the new plume shells, the following alternatives were presented:

Alternative 1 – No Action

Alternative 2 – Long-Term Management incorporating Long Term Monitoring and land use control management. **EPA asked for more information on Alternative 2 cost. Ms. Thomas will provide.**

Alternative 3 – In-plume one-well treatment, 125 gpm (variations of turning off the well at various timeframes). A single well would be centrally located between the highest mass of perchlorate and the highest mass of RDX.

Alternative 4 – In-plume (hot-spot) 2-well treatment system at 250 gpm (variations) focused on the two areas of higher concentrations, one for perchlorate and one for RDX, with varying operation timeframes for the wells. One well located downgradient close to MW-370 and one well located upgradient focused on the higher mass of RDX.

Alternative 5 – Treatment to achieve cleanup within ten years using 2 ppb for perchlorate and 0.6 ppb for RDX. There is not currently a model scenario that achieves this within ten years. It is anticipated that it would take approximately five extraction wells at approximately 600 gpm to reach this objective and run to approximately 2019 at approximately \$20 million dollars.

Perchlorate and RDX animations were shown.

A Preliminary Alternative Performance Table was presented showing the model run, estimated year perchlorate decreases below 2 g/L, estimated year RDX decreases below 0.6, 2, 6 g/L, estimated EW shutoff year, and preliminary present value cost for each alternative. The assumptions were that the treatment facility is located on Chadwick Road and the pipeline will head north from there.

The next step is to discuss the alternatives at the October 30 tech meeting.

IART Meeting for October 2008

The MMR Clean up Team (MMRCT), formerly the Impact Area Review Team (IART) and the Plume Cleanup Team (PCT) held a meeting on 10 October 2008. Discussion items included: Installation Restoration Program (IRP) updates, Impact Area Groundwater Study Program (IAGWSP) Remediation and Investigation updates, Massachusetts Army National Guard (MAARNG) Small Arms Range update and IAGWSP CIA briefing.

The next meeting will be held 19 November 2008. The agenda will include late breaking news and responses to action items, as well as updates from the IAGWSP, MAARNG and IRP. The MMRCT meetings provide a forum for community input regarding issues related to both the IRP and the IAGWSP.

3. SUMMARY OF DATA RECEIVED

Table 4 summarizes the detections in groundwater, since 1997, that equaled or exceeded an EPA Maximum Contaminant Level (MCL), MassDEP MCL (MMCL) or Health Advisory (HA) for

drinking water. Table 4 is updated on a monthly basis; discussions in the text are updated on the same schedule as Figures 1 through 8, which are discussed later in this section.

Table 5 summarizes the validated detections of explosives and perchlorate for all groundwater results received from 01 October through 31 October 2008. These results are compared to the MCL/HA values for respective analytes. First-time validated detections of Volatile Organic Compounds (VOC), Semi-Volatile Organic Compounds (SVOC), metals, herbicides and pesticides are included and discussed quarterly in the March, June, September, and December Monthly Progress Reports. Metals, chloroform, and bis (2-ethylhexyl) phthalate (BEHP) are excluded from Table 5 for the following reasons: metals are a natural component of groundwater, particularly at levels below MCLs or HAs; detections of chloroform are pervasive throughout Cape Cod and are not likely the result of military training activities; and BEHP is believed to be largely an artifact of the investigation methods and may be introduced to the samples during collection or analysis.

Figures 1 through 8 depict the cumulative results of groundwater analyses for the period from the start of the Impact Area Groundwater Study (1997) to the present. There are no new groundwater data to report for metals, VOC, SVOC, metals, pesticides or herbicides. The figures for this month's report are included on CD only. Each figure depicts results for a different analyte class:

- Figure 1 shows the results of explosive analyses by EPA Method 8330. This figure is updated and included each month.
- Figure 2 shows the results of inorganic analyses (collectively referred to as "metals", though some analytes are not true metals) by methods E200.8, 300.0, 350.2M, 353M, 365.2, CYAN, IM40MB, IM40MBM, and IM40HG. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 3 shows the results of VOC analyses by methods OC21V, OC21VM, 504, 8021W, and SW8260 exclusive of chloroform detections. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 4 shows the chloroform results using the VOC analyses by method OC21V and OC21VM. This figure is included semi-annually in the June and December Monthly Progress Reports.
- Figure 5 shows the results of SVOC analyses by methods OC21B and SW8270, exclusive of detections of BEHP. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 6 shows the BEHP results using the SVOC analyses by methods OC21B and SW8270. This figure is included semi-annually in the June and December Monthly Progress Reports.
- Figure 7 shows the results of Pesticide (method OL21P) and Herbicide (method 8151) analyses. This figure is included quarterly in the March, June, September, and December Monthly Progress Reports.
- Figure 8 shows the results of Perchlorate analysis by method E314.0. This figure is updated and included each month.

The concentrations from these analyses are depicted in Figures 1 through 8 compared to Maximum Contaminant Levels (MCLs) or Health Advisories (HAs) published by EPA for drinking water. The color coded legends are defined on each figure.

There are multiple labels listed for some wells in Figures 1 through 8, which indicate multiple well screens at different depths throughout the aquifer. The aquifer is approximately 200 to 300 feet thick in the study area. Well screens are positioned throughout this thickness based on various factors, including the results of groundwater profile samples, the geology, and projected locations of contaminants estimated by groundwater modeling. Generally, groundwater entering the top of the aquifer will move deeper into the aquifer as it moves radially outward from the top of the water table mound. Light blue dashed lines in Figures 1 through 8 depict water table contours. Groundwater generally moves perpendicular to these contours, starting at the center of the 70-foot contour (the top of the mound) and moving radially outward. The rate of vertical groundwater flow deeper into the aquifer slows as groundwater moves away from the mound.

The results presented in Figures 1 through 8 are cumulative, which provides a historical perspective on the data rather than a depiction of current conditions. Any detection at a well that equals or exceeds the MCL/DWEL/HA results in the well having a red symbol, regardless of later detections at lower concentrations, or later non-detects. The difference between historical and current conditions is generally contributed to the effectiveness of remedial actions. ETR systems are in operation at Demo1, J-1 South, J-2 North, J-2 East and J-3 Ranges to treat contaminated groundwater in order to control further migration of explosives compounds and/or perchlorate.

Figure 1: Explosives Compounds in Groundwater Compared to MCLs/HAs

Changes in detection trends in groundwater samples collected during the fall 2008 system performance and long term monitoring sampling events at respective study areas are discussed in biweekly data updates (*Summary of Explosives and Perchlorate Results*).

Exceedances of drinking water criteria for explosives compounds have been indicated in seven general areas:

- Demo Area 1 (wells 19, 31, 34, 73, 76, 77, 114, 129, 139, 165, 210, and 211);
- Demo Area 2 (wells 16, 160, 259, 262, and 404);
- Former A Range (well 206);
- The Impact Area and CS-19 (wells 58MW0001, 58MW0002, 58MW0009E, 58MW0011D, 58MW0016B, 58MW0016C, 58MW0018B; and wells 1, 2, 23, 25, 37, 38, 40, 43, 85, 86, 87, 88, 89, 90, 91, 93, 95, 98, 99, 100, 101, 102, 105, 107, 111, 112, 113, 176, 178, 184, 201, 203, 204, 207, 209, 212, 223, 235, OW-1, OW-2, and OW-6);
- J Ranges and southeast of the J Ranges (wells 45, 58, 130, 132, 147, 153, 163, 164, 166, 171, 191, 193, 196, 198, 215, 218, 227, 232, 234, 247, 265, 289, 303, 306, 324, 326, 343, 360, 368, 369, 398, 477, 481, 485, 486, 487, and wells 90MW0022, 90MW0041, 90MW0054 and 90WT0013); and
- Northwest Corner of Base Boundary (well 323).

Exceedances of drinking water criteria were measured for TNT at Demo Area 1 (MW-19S, MW-31S, MW-31M, and MW-31D) and Southeast of the Ranges (MW-196S). Exceedances of the HA for RDX were noted at all of the locations listed above except at MW-45. An exceedance of drinking water criterion was measured for 2,6-dinitrotoluene (2,6-DNT) in one sample collected from MW-45S.

Demo Area 1 has a single well-defined source area and extent of contamination. As noted in Section 1 above, ETR systems at Frank Perkins Road and Pew Road in the Demo 1 study area

include extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

Demo Area 2 has had groundwater exceedances of the RDX HA at MW-16S, MW-160S, MW-259, MW-262M1, and MW-404M2. The extent of the contamination is currently under investigation.

The Former A Range has had exceedances of the RDX HA at MW-206M1. The S screen in this location is non-detect for all explosives.

The Impact Area has a plume defined by RDX concentrations above the HA of 2 ppb. The plume originates primarily along Turpentine Road and extends downgradient to the west-northwest. Another source of RDX in the Impact Area is CS-19. Portions of CS-19 are currently under investigation by the Air Force Center for Environmental Excellence (AFCEE) under the Superfund program.

The Southeast Ranges have several groundwater plumes defined by concentrations of RDX and/or perchlorate above the HA of 2 ppb. Identified RDX plumes include:, J-2 Range North, J-3 Range, J-1 Range South, J-2 Range East, J-1 Range North and L Range. Groundwater treatment systems are currently in place and operational at J-1 Range South, J-2 Range North, J-3 Range and J-2 Range East.

The Northwest Corner of the base boundary has validated detections of RDX in groundwater above the HA of 2 ppb at MW-323M2. The M1 screen in this location has validated detections of RDX in groundwater below 2 ppb. The S screen at this location is non-detect for explosives.

Figure 2: Metals in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for metals are scattered throughout the study area. Where two or more rounds of sampling data are available, the exceedances generally have not been replicated in consecutive sampling rounds. The exceedances have been measured for antimony, arsenic, cadmium, chromium, lead, molybdenum, sodium, thallium and zinc. Exceedances of the arsenic drinking water criteria were repeated at three (wells 58MW0010A, MW-7M1 and MW-45S) of the six locations with arsenic exceedances. At the remaining three locations (wells MW-3D, MW-52M2 and MW-152M1), arsenic exceedances were not repeated in subsequent results. Cadmium (well MW-52M3) and chromium (well MW-7M1) were each detected above drinking water criteria in a single sampling round in October-October 1999. Exceedances of the drinking water criteria for lead were repeated at two of four locations (wells ASP and MW-45S). At the remaining two locations (wells MW-2S and MW-7M1) lead exceedances were not repeated in subsequent results. Exceedances of the drinking water criteria for molybdenum were repeated at two of eight locations (wells MW-53M1 and MW-54S) with molybdenum exceedances. All of the molybdenum exceedances were observed in year 1998 and 1999 results. Exceedances of the drinking water criteria for sodium were repeated at 12 of the 21 locations with sodium exceedances (wells MW-2S, MW-21S, MW-46S, MW-57M3, MW-57M2, MW-57M1, MW-144S, MW-145S, MW-148S, MW-187D, ASP and SDW261160). Seven wells (MW-21S, MW-57M1, MW-57M3, MW-187D, BHW215083B, BHW215083D and ASP) had sodium exceedances in year 2004, 2005, and/or 2006 results. Zinc exceeded the HA in seven wells, all of which are constructed of galvanized (zinc-coated) steel.

Groundwater samples sent for target analyte metals analysis are analyzed by Inductively Coupled Plasma (ICP) in accordance with EPA method SW846/6010 with the exception of

thallium and antimony. Groundwater samples submitted for antimony and/or thallium analysis are analyzed by Inductively Coupled Plasma/Mass Spectroscopy (ICP/MS) in accordance with the EPA Method SW846/6020. The ICP/MS Method 6020 has greater sensitivity, lower detection limits and the added feature of selectivity for antimony and thallium.

There have been few exceedances of drinking water limits for antimony and thallium since the introduction of more sensitive methods. Antimony levels exceeding drinking water criteria were detected in samples from 13 locations; these levels were not detected in subsequent sampling rounds. Only two antimony exceedances (wells MW-38M2 and MW-73S) were measured since January 2003. Twelve of the 71 locations with thallium exceedances had repeated exceedances in subsequent sampling rounds (wells MW-7M1, MW-7M2, MW-19S, MW-45S, MW-47M2, MW-47M3, MW-52S, MW-52D, MW-54S, MW-54M1, MW-58S and MW-94M2). There have been no exceedances of thallium since January 2003.

The distribution and lack of repeatability of the metals exceedances is not consistent with a contaminant source, nor do the detections appear to be correlated with the presence of explosives or other organic compounds. The IAGWSP evaluated inorganic background concentrations using the groundwater quality database of 1999, and submitted a draft report describing background groundwater quality in December 1999.

Figure 3: VOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for VOCs are indicated in six general areas: Northeast Corner (well LRMW003), Impact Area boundary (MW-28S), CS-10 (wells 03MW0007A, 03MW0014A, and 03MW0020), FS-12 (wells MW-45S, 90MW0003, and ECMWSNP02D), and in the J-1 Range (well MW-187D). CS-10, LF-1 and FS-12 are sites located near the southern extent of the Training Ranges that are currently under investigation by AFCEE under the Superfund program. Exceedances of drinking water criteria were measured for tetrachloroethylene (PCE) at CS-10, for vinyl chloride at LF-1, and for methylene chloride, toluene, 1,2-dichloroethane, and ethylene dibromide (EDB) at FS-12. These compounds are believed to be associated with the sites under investigation by AFCEE; these sites currently have active treatment systems in place.

Figure 4: Chloroform in Groundwater Compared to MCLs

Chloroform has been widely detected in groundwater across the Upper Cape as stated in a joint press release from USEPA, MassDEP, IRP, and the Joint Programs Office. The Cape Cod Commission (2001) in their review of public water supply wells for 1999 found greater than 75% contained chloroform with an average concentration of 4.7 ug/L. The IRP has concluded chloroform is not the result of Air Force activities. A detailed discussion of the presence of chloroform is provided in the Final Central Impact Area Groundwater Report (06/01).

Figure 5: SVOCs in Groundwater Compared to MCLs/HAs

Exceedances of drinking water criteria for SVOCs are scattered throughout the study area. All exceedances of drinking water criteria for SVOCs were measured for bis (2-ethylhexyl) phthalate (BEHP), with the exception of two wells. MW-264M1 (J-3 Range) had a detection of benzo(a)pyrene at concentrations of more than twice the HA and MW-241M1 (L Range) had detections of naphthalene above the HA of 100 ppb. Detections of BEHP are presented separately in Figure 6 and discussed in the next paragraph.

Figure 6: BEHP in Groundwater Compared to MCLs

Exceedances of drinking water criteria for bis (2-ethylhexyl) phthalate (BEHP) are scattered throughout the study area. BEHP is believed to be largely an artifact of the investigation methods and may be introduced to the samples during collection or analysis. However, the potential that some of the detections of BEHP are the result of activities conducted at MMR has not been ruled out.

A detailed discussion of the presence of BEHP is provided in the Draft Completion of Work Report (7/98) and subsequent responses to comments. The theory that BEHP mostly occurs as an artifact, and is not really present in the aquifer, is supported by the results of subsequent sampling rounds that show much lower levels of the chemical after additional precautions were taken to prevent cross-contamination during sample collection and analysis. Only four locations (out of 93) showed BEHP exceedances in consecutive sampling rounds: 28MW0106 (located near SD-5, a site under investigation by AFCCEE), 58MW0006E (located at CS-19), 90WT0013 (located at FS-12), and MW-146M1 (located at L Range). Subsequent sampling rounds at all these locations have had results below the MCL. Eleven wells (27MW0705, 27MW2061, C2-B, C6-C, C7-B, MW-47M2, MW-164M1, MW-168M1, MW-188M1, MW-196M1, and MW-198M1) had BEHP exceedances in the year 2002 and 2003 results. There have been no exceedances of BEHP in 2004, one exceedance of BEHP, at MW-356M1 (J-3 Range), in 2005, and one exceedance of BEHP, at MW-477M2 (J-1 Range), in 2007.

Figure 7: Herbicides and Pesticides in Groundwater Compared to MCLs/HAs

There has been one exceedance of drinking water criteria for pesticides, at well PPAWSMW-1. A contractor to the United States Air Force installed this monitoring well at the PAVE PAWS radar station in accordance with the Massachusetts Contingency Plan (MCP), in order to evaluate contamination from a fuel spill. The exceedance was for the pesticide dieldrin in a sample collected in October 1999. This well was sampled again in November 1999. The results of the November sample indicate no detectable pesticides although hydrocarbon interference was noted. It appears from the November sample that pesticides identified in the October sample were false positives.

There has been one exceedance of drinking water criteria for herbicides, at well MW-41M1 (Impact Area). This response well was installed downgradient of the Impact Area. The exceedance was for the herbicide pentachlorophenol in a sample collected in October 2000. There were no detections above the MCL of this compound in the three previous sampling rounds in 1999, nor in the subsequent sampling rounds in 2000, 2001, 2002, and 2003.

Figure 8: Perchlorate in Groundwater Compared to a 2 ppb Concentration

Changes in detection trends in groundwater samples collected during the fall 2008 system performance and long term monitoring sampling events at respective study areas are discussed in biweekly data updates (*Summary of Explosives and Perchlorate Results*).

Sampling and analysis of groundwater for perchlorate was initiated at the end of the year 2000 as part of the IAGWSP. Cumulative exceedances of the 2 ppb concentration of perchlorate have been indicated in seven general areas:

- Demo Area 1 (wells 19, 31, 32, 33, 34, 35, 36, 73, 75, 76, 77, 78, 114, 129, 139, 162, 165, 172, 210, 211, 225, 255, 258 and 341);

- Impact Area and CS-19 (wells 58MW0009C, 58MW0015; and wells 38, 89, 91, 93, 101, and OW-1);
- J Ranges and southeast of the J Ranges (wells 93, 125, 127, 128, 130, 132, 142, 143, 158, 163, 166, 193, 197, 198, 215, 232, 234, 237, 243, 247, 250, 263, 265, 286, 289, 293, 295, 300, 302, 303, 305, 307, 310, 313, 319, 321, 324, 326, 329, 335, 339, 343, 346, 348, 366, 368, 370, 393, and wells 90PZ0211, 90MW0022 and 90MW0054, 90WT0013, J2EW3-MW-2-B, and RS003P);
- Northwest Corner of Base Boundary (wells 4036009DC, 66, 270, 277, 278, 279, 283, 284, 287, 297, 301, 309, 323, and RSN0W3); and
- Western Boundary (wells 80, 233, and 267).

Demo Area 1 has a single well-defined source area and extent of contamination. As noted in Section 1 above; ETR systems at Frank Perkins Road and Pew Road in the Demo 1 study area include extraction wells, ex-situ treatment processes to remove explosives and perchlorate from the groundwater, and injection wells to return treated water to the aquifer.

The Impact Area has had eight locations with exceedances of the 2 ppb concentration of perchlorate. The perchlorate plume extends from near the center of the Impact Area to the northwest, in the vicinity of Burgoyne Road.

The Southeast Ranges have several groundwater plumes defined by concentrations of RDX and/or perchlorate above the HA of 2 ppb. Perchlorate plumes have been identified in four areas in the Southeast Ranges. Identified perchlorate plumes include: J-2 Range North, J-3 Range and J-2 Range East. Groundwater treatment systems are currently in place and operational at J-2 Range North, J-3 Range and J-2 Range East.

The Northwest Corner has a perchlorate plume extending from Canal View Road at the base boundary to the Cape Cod Canal. This area is under investigation and the plume will be updated and refined as new data is received.

The Western Boundary has had three locations (MW-80M1, MW-233M3, and MW-267M1) which have exceeded the 2 ppb perchlorate MMCL in one or more sampling rounds. Only MW-233M3 has perchlorate detected above the 2ppb MMCL in the most recent sampling round (3/28/08). The perchlorate results for other Western Boundary wells are all below the MMCL.

4. DELIVERABLES SUBMITTED

Deliverables submitted during the reporting period include the following:

Monthly Progress Report No. 138 September 2008	10/10/2008
Draft J-1 Range Groundwater RRA Six-Month System Performance Monitoring Report	10/03/2008
<i>Final Revised J-3 Range Remedial Investigation Soil Sampling Project Note</i>	10/10/2008
Final J-1 Range North Interim Groundwater Monitoring Data Submittal	10/10/2008

5. SCHEDULED ACTIONS

Figure 9 provides a Gantt chart updated as of 02 February 2008, to reflect progress and proposed work. This figure has not changed since the last report and is included on CD only.

The following documents are being prepared or revised during October:

- J-1 Range South Soil/Groundwater Final Remedial Investigation/Feasibility Study Report
- J-2 Range Groundwater Interim Remedial Investigation/Feasibility Study Report
- J-3 Range Groundwater Interim Remedial Investigation/Feasibility Study Report
- L Range South Soil/Groundwater Draft Remedial Investigation/Feasibility Study Report

TABLE 2
Sampling Progress
